END OF TERM ONE ASSESSMENT
GEOGRAPHY
Paper 1
Senior Five
2026
2 hours 15 minutes

INSTRUCTIONS
This examination paper consists of **two** *assessment items*
Attempt **all** *items*
Neat handwriting with relevant explanations and examples leads to the award of high scores
Diagram work **must** *be done in pencils*
All your responses **must** *be written in the answer booklet(s) provided*

Item 1
Following a series of field observations conducted in different parts of East Africa, a group of geography students compiled a report on the visible features of the Earth's surface. Their study focused on examining the various natural components that interact at or near the surface, including landforms, water bodies, and the surrounding air.
The report emphasized how these components are arranged and how they collectively form the outer part of the Earth that supports life and human activities.
After the study tour, every learner had its own compiled information different from one another. They came back for presentations which were organized as a debate by their Geography teacher. At the debate presentation, some learners argued that the Earth's outer layers are composed of ten layers. This sparked different arguments which were about to cause a fight between different groups.
You were part of the debate presentation and it was your time to challenge the rest of your classmates on what you observed and compiled so that it would calm down the argument.

Task

Using information in the scenario, what will be your presentation?

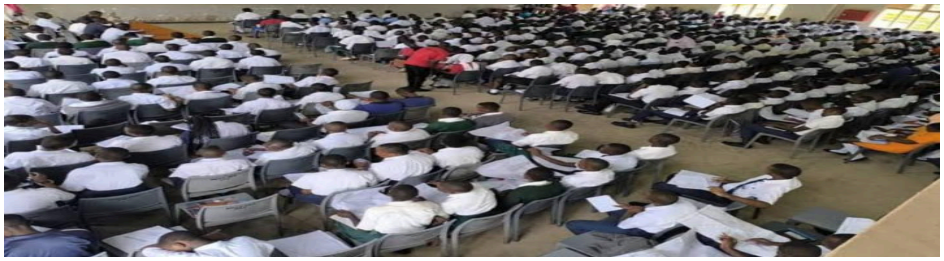

Item 2

During a regional scientific conference held in East Africa, a team of geologists presented findings from a recent underground investigation project. The project involved studying deep Earth features using advanced scientific techniques after unusual ground vibrations were recorded in several parts of the region.

Their report highlighted variations in the composition and behavior of materials beneath the Earth's surface, as well as the different approaches used to gather such information without direct access to deep layers.

The findings sparked interest among students and researchers, especially regarding how scientists are able to understand what lies far beneath the Earth's crust and how the internal arrangement of the Earth influences surface phenomena.

Since you were part of the conference,you were identified by the chief guest to clarify and give a report on what you researched based on different dynamics that lie beneath the earth so that they publish it to the National Curriculum Development Centre (NCDC)Uganda.

Task

Write a report to the National Curriculum Development Centre (NCDC) that will be used for the next online conference with all Geographers in Uganda scheduled in next term.

END
