STEPS ON HOW TO DRAW A CROSS SECTION/TRANSECT/RELIEF OF AN AREA ON A MAP EXTRACT IN GEOGRAPHY

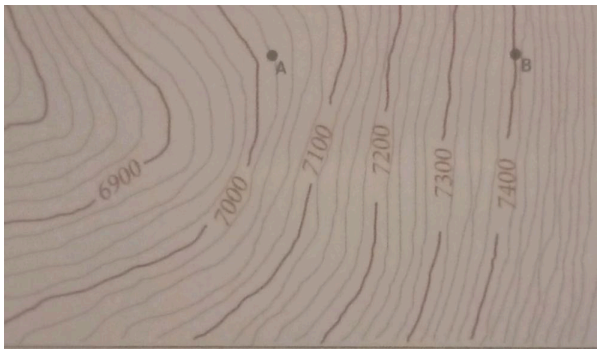

(All levels)

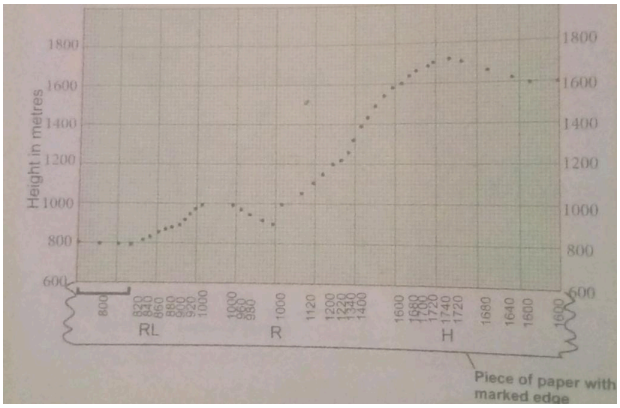

Map Extract of Minakulu

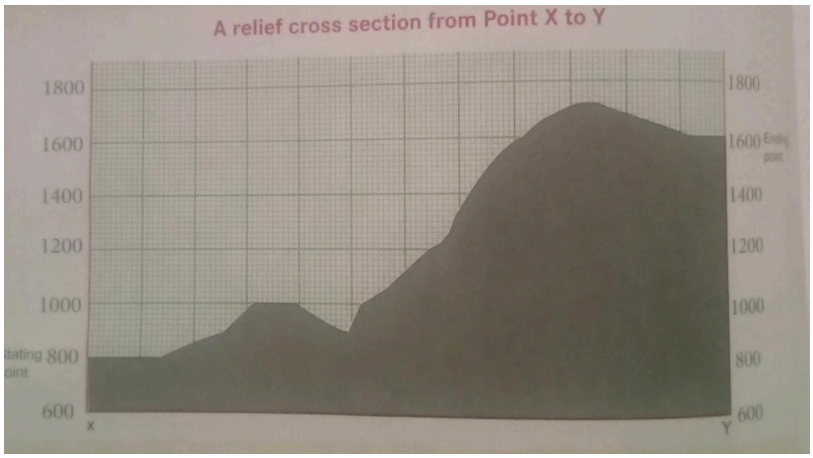

Map Extract of Butiaba with illustrations step by step!

EAST AFRICA 1:50,000 (UGANDA)
BUTIABA
Sheet 38/2
BUKUMI-BUGUNGU HUNTING AREA
LAKE ALBERT
OMUGWERA
BUTIABA HARBOUR
KAKERE
BUDONGO FOREST
RESERVE
OMUHOOGA
KATEMWA
EAST
Grid North

Examples of a relief section/cross section/transect.

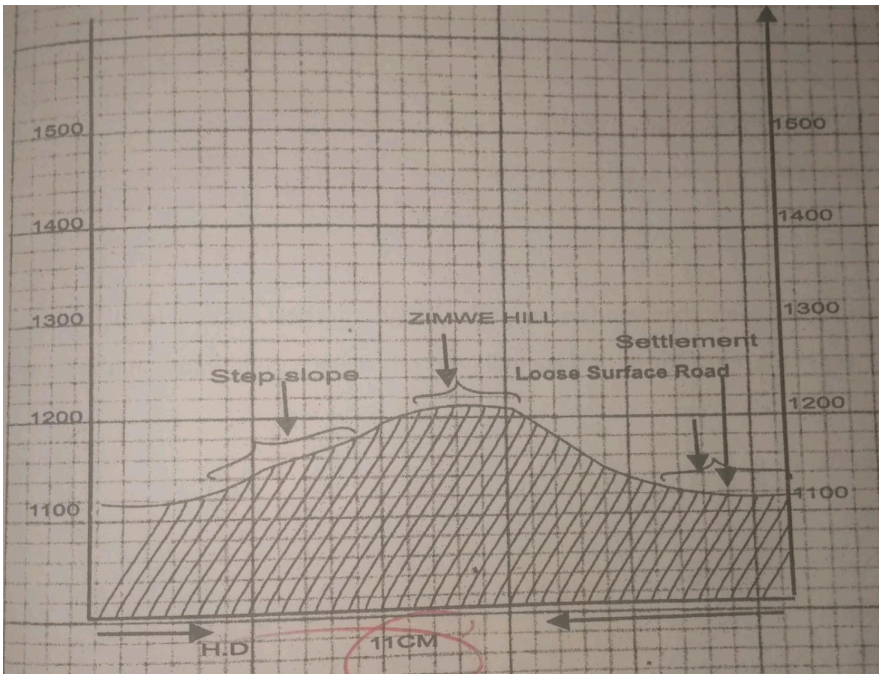

Figure (i)

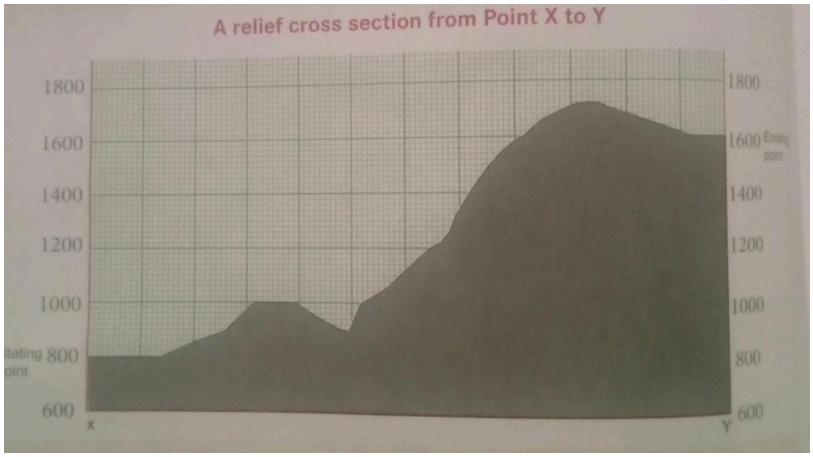

Figure (ii)

Here Are The Steps!

1.Get the figure of the Highest contour line

2. Get the figure of the Lowest contour line of the intended cross section to be drawn.

3. Get the amplitude [range].

4. Get the Lowest contour line and subtract the range to get the starting point instead of Zero.

5. Get the highest contour Line and add the range.

6. That scale MUST be between 3-4 cm on the graph paper.

7. Assuming the HCL is 5500fts, LCL is 4500fts, then the range will be; 5500-4000= 1000fts.

8. Starting point will be 45000-1000=3500

9. End point will be 5500+1000=6500

10. The scale used is 1cm and represents 1000fts on a vertical scale.

11. Your starting point is 3500, go on adding the range I.e 3500+ 1000= 4500 +1000=5500+1000=6500feets. Those are 4cm. I submit.

NOTE: Most times the range is always given as VI on the extreme right hand corner of the map extract.
