BUDDO SECONDARY SCHOOL
ANNUAL GEOGRAPHY SEMINAR, SATURDAY 27TH JUNE, 2026

BUDDO SECONDARY SCHOOL
THE STRUGGLE CONTINUES

P250: GEOGRAPHY

SEMINAR ITEMS

P250/1
Item.1.
For this item use the East Africa (Uganda) map extract of Moroto, Series 1732, about 27/3
Edition 5-D.O.S.
Moroto is one of the districts of Karamoja in North Eastern Uganda located between Latitude 2º 30' and 2° 40' North of the Equator and Longitude 34° 35' and 34° 45' East of the Greenwich meridian.
The region has for many years been regarded as one of the least developed in the country despite having a variety of valuable resources such as minerals and vast land. The local Council Administration in Moroto has organized a Consultative meeting at Moroto Town with various stakeholders in the region and you are to represent the youth. The main agenda of the meeting is to investigate the challenges limiting development in the region and suggest sustainable solutions to address them.

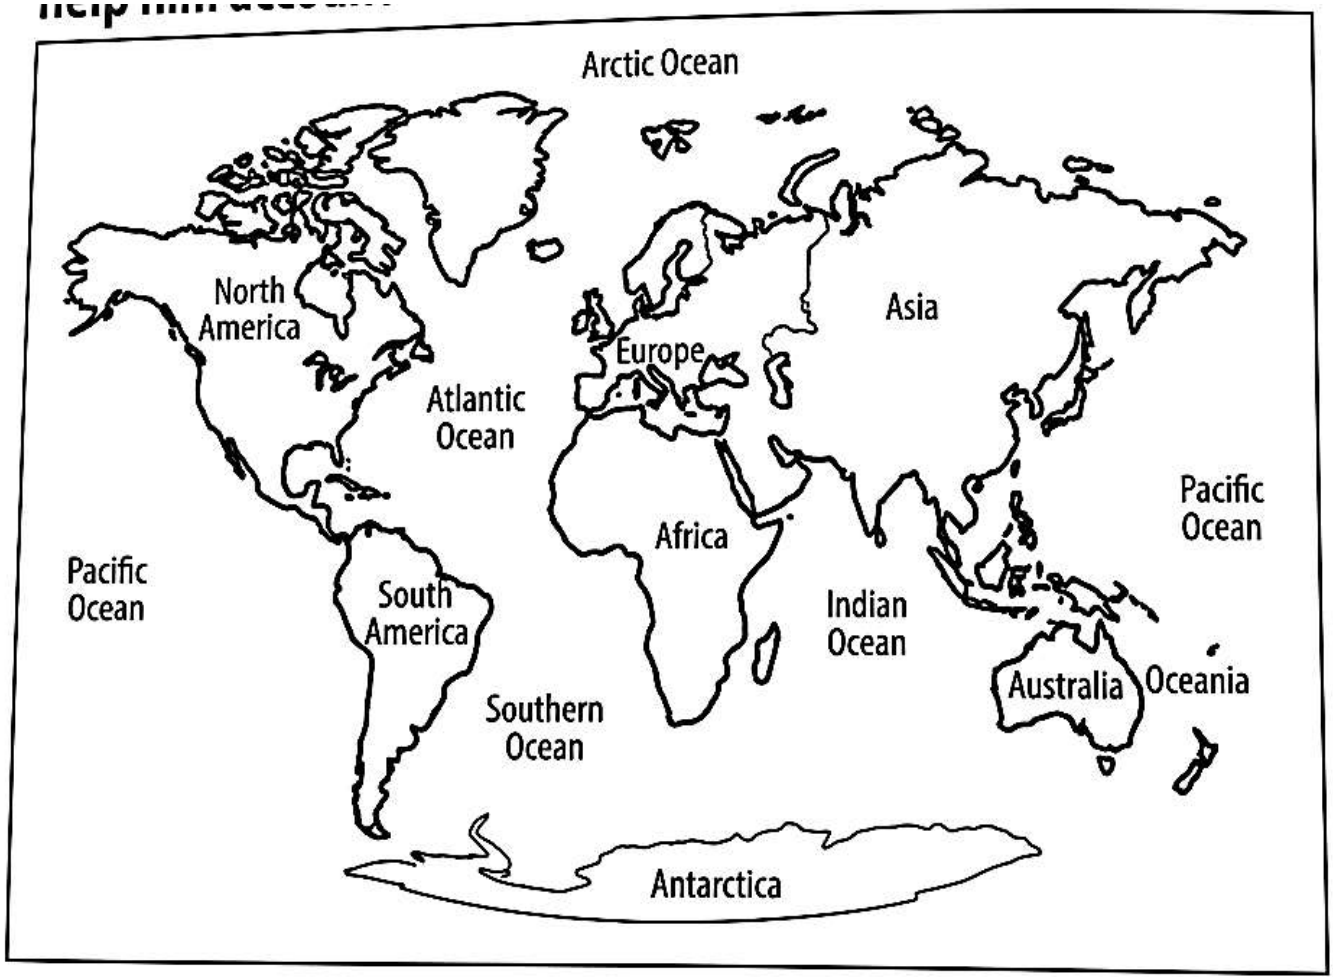

Task (a)
Prepare a write-up to guide your discussions. The write-up should include a suitable illustration of the landscape of the area and strategies to address the main agenda of the meeting citing evidence from the map.

Task (b)
A mining company in Moroto is stationed at grid reference 790820 has of recent discovered more mineral deposits at 850770. With the use of a suitable illustration show the natural features in the area.

Item 2.
A S.5 geography student while watching a documentary on a local television about the earth and it its wonders, listened carefully as he observed images being displayed. He noted that the earth has several major continents and sub continents and that these continents are aligned in a way that if brought close to each other their coastal margin could easily fit into each other. This was demonstrated by bringing continents and the

two were connecting easily. He further observed that at the point where the two continents connected from, there was clear evidence that the two continents had similar animal and plant species.
The presenter showed that what was demonstrated was equally true for the other continents. When brought close to each other they would easily fit their neighbouring continents.

This learner failed to understand clearly how this came about and has come to you to help him account for this situation.

Task.
Make a write up that you will use to explain to this S.5 learner, in it show the current distribution of continents, any one theory relating to what he saw, and evidences to support the explanation.

Item 3:

East Africa is blessed with a variety of topographical features ranging from uplands to lowlands. You are attached to a team of environmental planners conducting a field study in a region of Uganda characterized by an elongated depression bordered by steep slopes on either side. The floor of the depression contains lakes and wetlands suitable for fishing activity, extensive agricultural land and a diverse wildlife. The area attracts tourists because of its unique scenery; however, despite these resource potentials, the area is still underdeveloped.

During the study, the local leaders expressed concern about a number of environmental and socio-economic challenges affecting the region and they sought your advice.

Following the field study, you have been requested to compile and present a report on the findings to the local leaders.

Task:

Prepare a report to be presented to the local leaders. The report should include a detailed explanation on the formation of the landform observed, challenges faced in the area and suggest appropriate measures to address them.

Item 4.

On your recent field work trip to Kabale and Kisoro, your tour guides indicated to you that the highlands you saw were the Kigezi highlands, they comprised of very steep slopes with exposed rocks and thin soils, gentle slopes with fairly deep soils and the low lands had deep soils.

You learnt that this area receives heavy rainfall and this was responsible for the massive down slope movement of large volumes of soils and rock boulders. This greatly affected crop land, transport networks, water sources, settlements and other social infrastructures which has led to famine and poverty as many people in the area

depended on agriculture.
From this field work study, your teacher tasked you to write a report that can contribute to the Nature Uganda Monthly Magazine.

Task:
Write a report of your findings, in this report include an account of the development of the mentioned slopes and the strategies to control slope related challenges.

Item 5.
Mombasa port is found along the East African Coast. It is gifted with beautiful scenery of several beaches, cliffs, coral rocks and a peninsular. Because of these attractions, a group of holiday makers from Europe chose to have their Christmas celebrations along this port.
On reaching the Coast, they realized that the water levels in the Ocean retreat back in the sea at night and only come back to the shoreline during the day. The visitors inquired from the area residents and the port authorities about the causes of water retreat into the sea and back to the shoreline but the responses showed ignorance of the causes. The port authorities chose to consult people with geographical knowledge of the phenomena so that they publish a magazine that will offer a lasting answer to the condition. You are among those consulted to provide information that will contribute to the articles in the magazine.

Task;
Write an article and in it, include the causes of the above condition and its major impact on the natural environment and human activities.

Item.6.

River Kagera is found in south western Uganda. Its source is in Rwanda probably in the Virunga ranges. It is one river with magnificent features which provide many opportunities to the communities around for improved livelihood. These features are erosional and depositional in nature visible from the upper, middle and lower stages of the river. Depositional features are more visible as the river sharply reduces its gradient towards its end.

Most of the potentials remain dormant and untapped at community level. Many attempts have been made but crop growing, sand mining, disposal of wastes have proven a challenge to the long-term sustainability of the river ecosystem and the human lives.

The Kagera basin initiative has launched a program aimed at promoting the river resources at the community level. One of the strategies is, to sensitize the community on the use of the resources.

You have been selected to prepare a written document for community education

Task:

Make a write-up that will be used to sensitize the communities along river Kagera on how best to use those features of the river. The report should contain an explanation of the erosional feature shown in the photograph above and how to improve the use of features found along the river channel.

Item 7:

Climate change is one of the greatest environmental challenges of our time. It is largely driven by both natural processes and human activities. Its impacts are global,

but they manifest differently across regions, influencing ecosystems, economics, and human livelihoods.

In East Africa, rainfall and sunshine once followed predictable seasonal cycles. Farmers relied on distinct wet and dry seasons to plan agricultural activities. However, in recent years, these patterns have drastically changed. Rainy seasons have turned into prolonged dry spells, creating little distinction between wet and dry periods. This has severely affected farming communities, leading to crop failures, food shortages, and increased vulnerability.

Beyond Africa, the effects of climate change are evident worldwide. Ice sheets in the Arctic and Polar Regions are melting, contributing to rising sea levels. In pastoral communities, competition for pasture has intensified, sparking conflicts and instability. In some areas, seas and lakes have started retreating, altering ecosystems and threatening water security. These changes have created fear, uncertainty, and instability in different parts of the world due to competition for scarce resources.

Recognizing the urgency of the situation, the Uganda Meteorological Association has approached you to carry out a feasibility study on climate change, focusing on its causes, challenges, and developmental implications.

Task

Make a write-up that you will present to the Association members. In your write-up include the causes of the phenomena in question, its negative effects and how it can be mitigated.

Item 8

A tourist from one of the Scandinavian countries made a trip to some countries in

Africa that have access to the coast. In Mozambique he realized that the country experiences warm and humid tropical climate with relatively high rainfall while Namibia is characterized by a cool, dry desert climate despite the fact that both countries are along the same latitude. He further realized that people in the two countries engage in different economic activities, they face varying environmental challenges and have developed unique adaptation strategies to survive and prosper. The tourist was puzzled about the differences that he encountered in the two countries despite their different geographical location but he could not explain the cause of these differences. He tried to seek for answers but many were ignorant. The African climatic board has organized a symposium where you have been invited to address these climatic differences.

Task.
Make a presentation that you will use to explain to this symposium. In it show the cause of difference in climate, how differences have influenced nature & distribution of economic activities and associated challenges.

P250/2
Item. 1. (A) Compulsory statistics
Uganda's population is growing rapidly from about 32 million people in 2014 to over 45.9 million people in April, 2024 with great differences in its distribution, growth and structure among different regions for example some regions like Northern and West Nile regions have high population growth rate due to improvement in infrastructure, security and influx of refugees from Democratic Republic of Congo and South Sudan while other regions are experiencing low growth rates due to economic reasons.
This growing population has greatly affected resource utilization, development and environmental sustainability.
The government of Uganda is concerned about the rapidly growing population and has organized a meeting in your community to sensitize the people on the causes and mitigation measures for population growth rate.
You have been invited in the meeting to address the community members.

Age Group	Male (%)	Female (%)
75+	0.1	0.3
70-74	0.3	0.4
65-69	0.5	0.5
60-64	0.9	0.7
55-59	1.5	1.2
50-54	1.7	1.9
45-49	1.9	2.4
40-44	2.5	2.9
35-39	2.7	3.1
30-34	3.8	3.4
25-29	4.5	4.2
20-24	5.2	4.3
15-19	5.8	5.0
10-14	6.5	6.6
5-9	7.6	7.6
0-4	9.0	8.9

Source: Adapted from UBOS report 2024

Task:

Source: Adapted from UBOS report 2024

Make a write up of the presentation which should include a suitable statistical graph, causes and the measures to overcome the challenges in the scenario.

(B)

Norway a Scandinavian country has been able to develop by making use of her natural resources. She has been able to tame nature where disasters like cyclones and tornadoes have disrupted her development. She has been able to engage in agriculture and fisheries, manufacturing and mining, minerals, commerce and transportation and tourism and leisure. Over years, the Norwegians have not been consistent in one

occupation. There has been a gradual shift from one job to another. This has been either accidental or planned as illustrated in the following table by percentage:

Year	Agriculture and fisheries	Industry and mining	Transport and trade	Tourism
1990	35	38	12	15
2010	20	39	21	20
2020	15	39	26	20
2025	05	41	29	25

Task:

a) Draw a suitable graph to show the information in the table and comment on the trend.

b) Write a report or presentation why this trend on agriculture and fisheries is typical of a developed country and what measures should a country like Uganda do to mitigate as seen in the scenario.

Item.2.

Most farmers in Uganda depend on subsistence farming for their livelihood for both food and a source of income. Over the years, this practice has persistently been carried out among some parts of North Eastern Uganda, Ankole, Masaka, and Northern Uganda among others, despite the challenges encountered by the farmers such as low output, low incomes, poor quality produce, stiff competition for markets for produce with other world producers, etc.

This has left farmers with less profits and incomes, hence less development, unlike their counterparts in developed countries like the Netherlands, USA, and Denmark that mainly practice commercial agriculture such as ranching, which has earned farmers high profits and development in their countries.

This has left farmers and leaders wondering what could be done about the trend in their farming practices and are worried about the future of their people and the country if nothing is done to revise this trend.

As a Geography student, you have been invited to represent Uganda at the African Union Summit (AU) to share views on how to improve farming among some communities in the member states so that they can compete favorably.

Task:
Prepare a presentation to address the persistent occurrence of the farming system and suggest possible measures that can be taken to improve the situation.

Item 3.
Karamoja is a region located in North Eastern Uganda; this region suffers from severe food shortage resulting into famine occurring almost every year. This has resulted into starvation and stunted growth in children less than five years leading to increased mortality rates among the vulnerable groups. Due to increasing food shortage, the region is experiencing population migrations, slow economic growth and social unrest. The community leaders in Karamoja region are getting worried due to increasing malnutrition and undernourishment leading to poor health, reduced life expectancy and increased food prices as well as high levels of poverty among the local people.
The government and non-government organizations (NGO) have organized a meeting to sensitize the community members in Karamoja on the challenges and measures to address the situation. You have been invited to attend the meeting.

Task:
Write a presentation you will use to address the community members on the causes and strategies to solve the situation in the scenario.

Item.4.
Mbale, a town in Uganda, is one of the most recently upgraded municipalities to city status. Like any other city, it is characterized by high population growth, sprawling building constructions, minimal traffic congestion, and varied land-use zoning extending from the centre (CBD) to the outskirts.
However, the new city is facing numerous challenges such as flooding, poor housing, insecurity, poor garbage disposal, and sluggish economic growth. Marginal lands are also under threat.
This has frustrated the efforts of urban planners to improve the livelihoods of the people, as they strive to transform the city into a modern one to match other cities like Cairo, Egypt. This has prompted the city's political leaders and technocrats to convene a meeting to come up with lasting solution so as to achieve the national urban plan theme of "Sustainable Urbanization - A Collective Responsibility". You have been privileged to be among the preselected delegates who will make a presentation on the matter.

Task:
Prepare a write-up that you will present in the meeting. Your write-up should include what went wrong and well as strategies that can be adopted to improve the city's status.

Item.5.

Wetlands are very important ecosystems in the world where livelihood of local people depend on them for survival with a variety of environmental, economic and social benefits. The senior six geography class of your school carried out a field work study on the impact of wetlands on human activities around the school. They observed that wetlands provide water, fish, are and craft materials. They also recorded that wetlands help in climate modification of the area, recreational value and a variety of medicinal plants. When they interviewed the chairperson of the area told them that there is increased encroachment and destruction of wetlands which has resulted into reduced size of wetlands, increased flooding and water pollution. The local leaders in the area have organized an urgent workshop at the district hall to address on the measures that can be adapted for sustainable use of wetlands in the area. As a member of the senior six geography class in your school, you have been invited to participate in this workshop.

Task

Prepare a fieldwork report which should include the objectives and methods used during the study, the causes and measures to address the situation in the scenario.

Item.6.

The energy resources have played a great role in stimulating the development of Uganda through industrial growth, urban expansion and exploitation of natural resources. In most parts of the rural areas of the country energy sector still remains unexploited. The district authorities are concerned why the energy sector has not been expanded to their area and if they don't extend power to the district. It may increase on unemployment, low standards of living, and wide spread poverty.
The ministry of energy, mineral and natural resources has invited the district leaders and other stakeholders for a meeting to discuss the strategies to ensure sustainable use of energy resources in the area.
As a student leader in your school, you have been invited to participate in the meeting.

Task:

Prepare a write up of the information to deliver at the meeting which should include Challenges facing energy resources and the strategies to address the situation.

Item.7.

Natural hazards have been a long-standing characteristic of the earth. This has seen every year where the Sahara swallows up acres of farmland as it marches inimitably towards the south and west. As human settlements get drier and drier, pastoralists depend on tiny patches of grasslands give up their herds and migrate to the cities. The once forested zones have transformed into woodlands, then to grasslands and thorny bush and scrub and eventually bare grounds. This has been observed through drying up

of streams and wells and severe variations in existing climate regimes. A local study exercise in your environment is famine, pasture withering, hot temperatures due to heat wave, rainfall seasonality and unreliability. This has raised serious environment concerns. You have been invited for a meeting to address the situation which you would present to on a local Television programme.

Task:
Write a report you would present on the television talk show on the causes of the trend and suggest steps you would apply to mitigate it as observed from the scenario.

END
