Item

Water in a river of a certain district in Uganda has been polluted with an alkaline chemical.
Authorities in the district are concerned. They have directed that the intensity of pollution at four different points along the river be established using the graphical method. They also want to know how the water pollution varies with distance from the point of discharge.

Samples of water along the river at distances of 20, 40 and 80 km from the source of pollution have been collected. However, the fourth point which is located 50 km away was inaccessible due to the dangers posed by wild animals.

You are provided with;

BA1, **BA2**, and **BA3** which are samples of polluted water collected at the distances of 20, 40 and 80 km respectively and **BA4**, which is dilute hydrochloric acid.

(The level of pollution could be determined by reacting the water samples with an acid.)

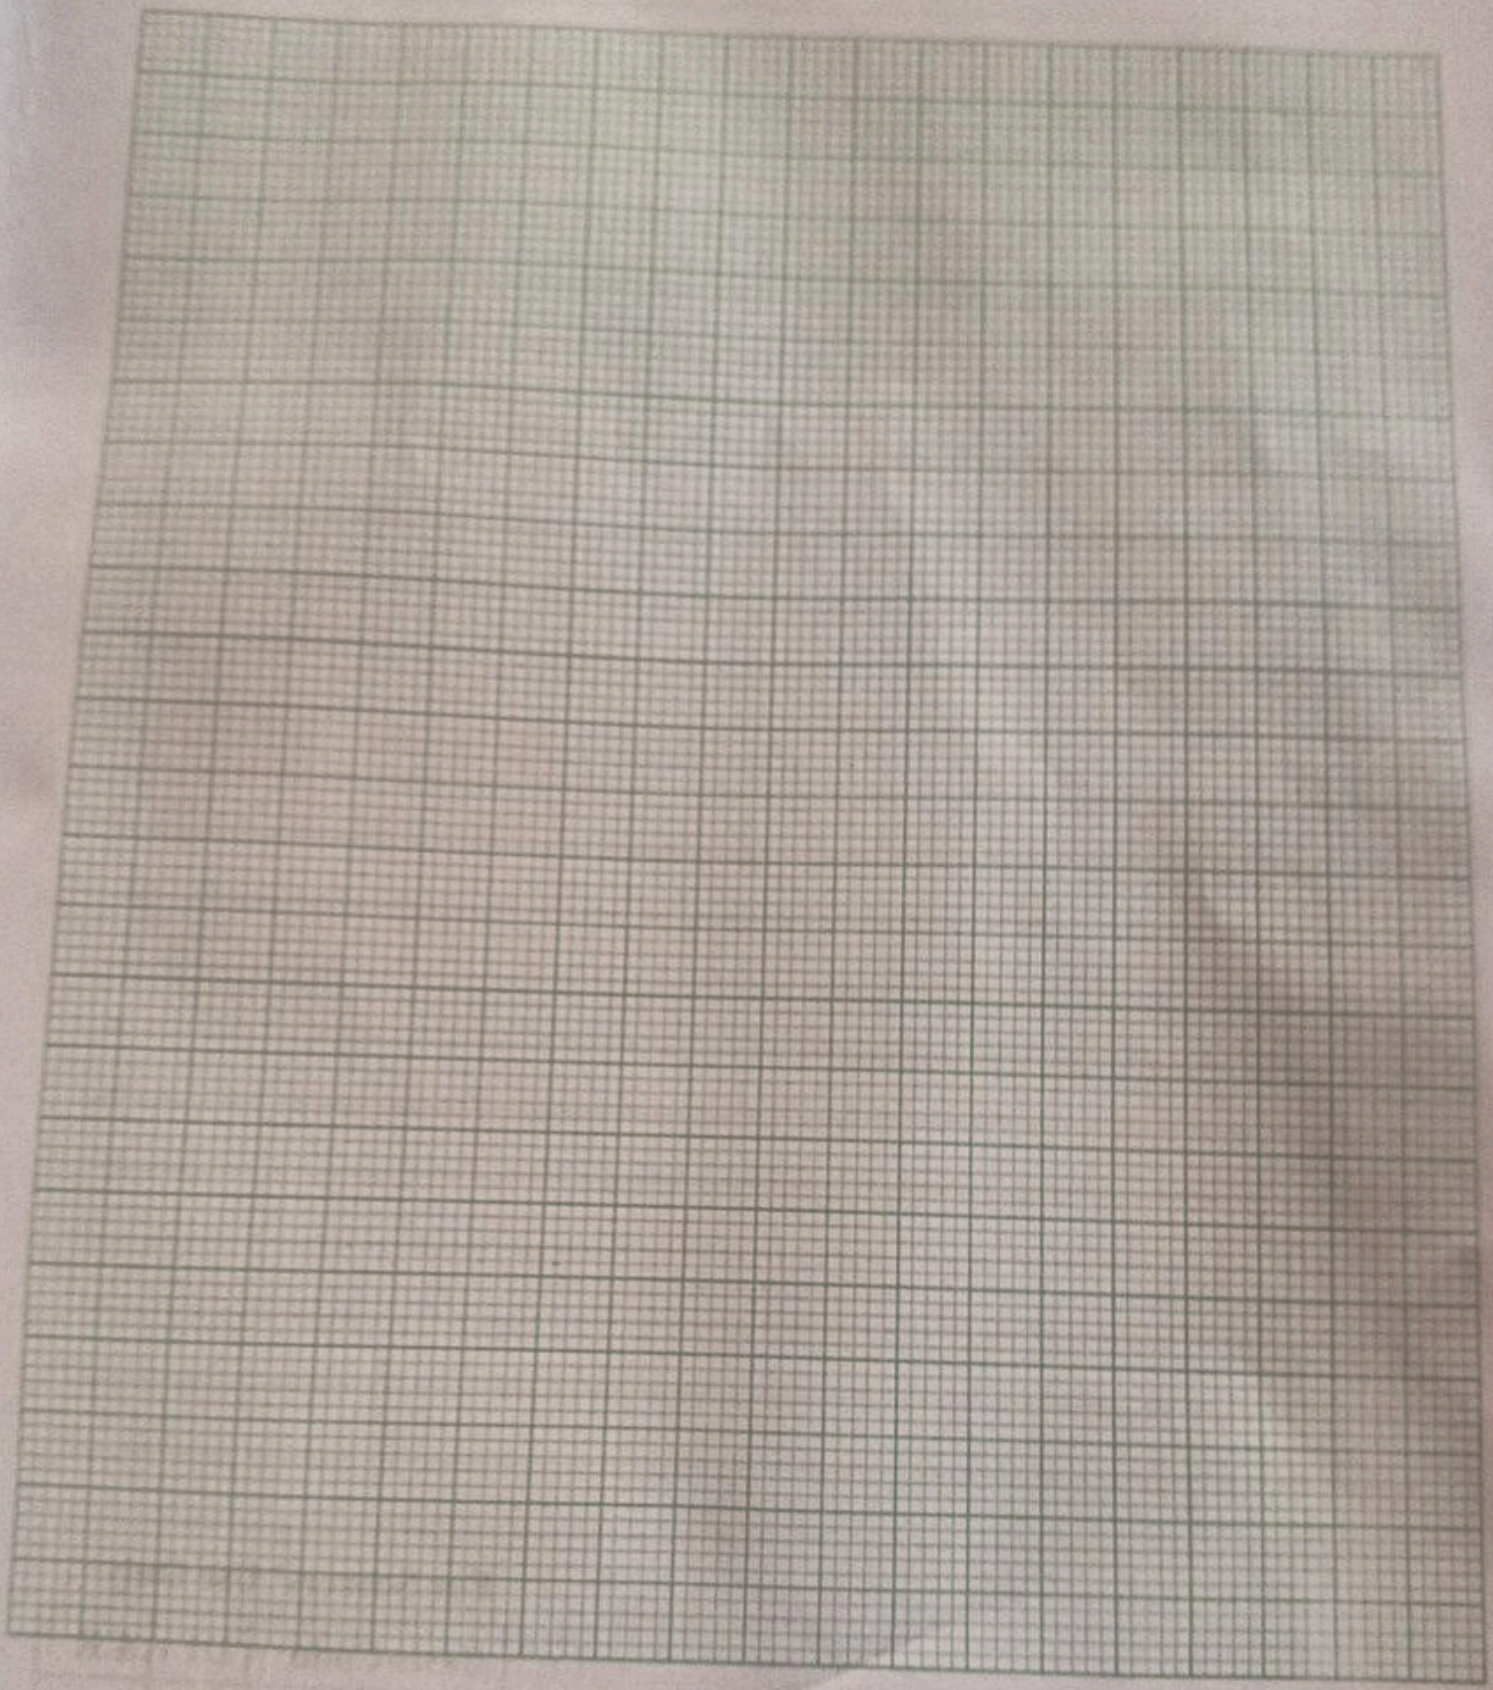

Tasks:

(a) Design and carry out a scientific investigation to address the concerns of the district authorities.
(*Your design should include; aim, hypothesis, variables, apparatus and materials, procedure, risks and their mitigations*.)

(b) Carry out the experiment and record your results.
(*A minimum of six readings required.*)
