AGRICULTURE MOCK EXAMINATIONS

Compiled Question Bank — 5 Mock Papers

(History paper excluded; items arranged by mock, in original order)

THE GOOD SHEPHERD

MOCK 1: KASSEC — Kayunga Secondary Schools Examinations Committee

Joint Mock 2026 — Agriculture, Paper 1

SECTION A

Item 1

Jude is a mixed farmer, rearing cattle and growing crops like maize, bananas among others. He keeps sacks of harvested maize inside the storage facility near the walls. Drying of maize takes place on a bare ground. Sometimes maize grains develop moulds and unpleasant smell, grains tend to contain small stones, he uses income from his farm sales to buy farm inputs, pay salaries and wages, meet domestic needs but sometimes makes unintended expenses. He likes working alone yet lacks collateral security to acquire a loan to boost his business. He accumulates a lot of farm wastes like cow dung, maize stalks, maize cobs, banana peelings and others. These produce a foul smell forcing neighbours to raise complaints. He observed that people from the neighbouring trading centre have high demand for charcoal which they buy expensively and there is a need for alternative cheaper fuel. He developed an idea of making briquettes to increase his earnings as he solves the problem of foul smell but he lacks knowledge about it.

Task:

- (a) Advise Jude on how better he should handle his farm produce and manage his farm business for increased profits.
- (b) Guide Jude on how he can make high quality briquettes from the farm wastes to increase earnings.

Item 2

Mary planted beans on a 4 acres' piece of land which she freely got from the nearby state land covered by a wetland. After soil sampling results showed that the pH of the soil was 10, rich in nitrogen and some parts of the land had reddish brown soil. She observed surface run off from a steep land into the lower part of the farm. The field was flooded with water which made bean plants to rot. At vegetative stage, she applied urea fertilizer to the soil in the field and later she found out that bean plants were putting on many dark green healthy-looking leaves at the expense of bean pods. Beans in the field were well managed in terms of timely weeding, pest and disease control but the actual yield was less than expected. Research shows that bean plants grow well in acidic soil, which is well drained and rich in organic matter.

Task:

- Advise Mary on how she can improve productivity of beans for maximum profits.

SECTION B: PART I — Animal Production

Item 3

Otim bought 15 Aberdeen Angus Cattle for milk production which he reared on an acre of land using rotational grazing system, his farm was located in a low-lying area, he confined cattle in a farm structure whose floor was finished off using a steel float. Otim fed his animals entirely on elephant grass which he planted at the farm. He observed brown small living organisms hiding in the fur of his cows around the horn base, the udder and below the vulva. All born male calves were left to grow to maturity and lived freely with females. Otim milks cows by holding the teat at the base between the thumb and the index finger and collects milk in a well cleaned plastic milk bucket. Animals are massaged with cold water before they are milked. Research data shows that exotic dairy breeds produce best if they are kept 1-3 cows per acre of pasture land, in areas with higher elevati

ons with cooler climate for maximum comfort and steady milk yield.

Task:

- Explain how Otim can ensure increased milk production at his farm.

Item 4

Jackie operates a fish farm in Zombo district. She usually constructs fish ponds on coarse textured soil with h igh water infiltration rate and stocks 5000 fingerlings per pond. She acquired fingerlings from the swamp that borders her farm. She stocks catfish with tilapia in the same pond. She routinely feeds fish on yam leaves. Pre dators such as Otters have a tendency of invading the ponds and eat fish, fish ponds tend to flood during rainy seas on. She applies lime in the fish ponds when the pH of pond water exceeds pH 7. Fish is harvested four m onths after stocking the ponds. Some tilapia fish slip through the net and fall back into the water. Research in dicates that tilapia fish takes 210 days to attain maturity and the stocking rate is 400 fingerlings each pond. T he fish enterprise generates low earnings.

Task:

- Advise Jackie on how she can overcome the challenges to maximise profits in her busines s.

PART II — Crop Production

Item 5

Mr Odongo planned to grow maize on thirty hectares of land. He cleared a piece of land and carried out primar y cultivation. He dug planting holes at recommended spacing and planted one seed per hole at a depth of 2cm. He planted maize using seeds from the previous crop harvest which was grown from hybrid maize variety DK 777. He observed spear grass growing between rows of planted maize and removed it by uprooting. He spraye d super green liquid fertiliser on leaves when maize had started flowering. Some maize plants were stunted an d developed white stripes parallel to the veins. Empty spaces were observed in the garden a week after plantin g maize. He harvested maize manually four months after planting the crop. The maize yield was too low and e arned less money from the market price. Research indicates that maize variety takes three and a half months to reach maturity, the recommended planting depth is 5cm, and it requires a fine seedbed.

Task:

- Advise Mr. Odongo on how he can ensure high yield from his crop.

Item 6

After receiving money from the parish development model of the government of Uganda, a farmer in Masaka d istrict developed an interest in coffee growing for wealthy creation. He planted Arabica Coffee variety on a pie ce of land which was on a lower altitude. He planted Coffee seedlings he found growing in the nearby natural f orest. He transplanted 2 seedlings per hole towards the end of the rainy season; all the seedlings were maintai ned in the field up to maturity. Due to the busy schedule he had, strange plants grew in the plantation and seve rely affected the coffee plants. Many branches developed on the same plant and were left to grow up to the fr uiting stage. Some coffee plants had orange powdery substances on the lower side of the leaves. Harvesting was done by stripping clusters with the mixture of green and red berries. Some coffee branches broke in the p rocess of harvesting. The farmer did not get the expected profits due to poor yields. Research shows that Arab ica Coffee grows well in areas whose altitude is 1,500m to 2,300m above sea level while Robusta Coffee does well in areas with altitude between 900m to 1,500m above sea level.

Task:

- Guide the farmer on how best he can manage Coffee plantation for more profits.

THE GOOD SHEPHERD

MOCK 2: UNNASE Joint Mock Examinations 2026

Agriculture

This section is compulsory

Item 1

Duran is an apple grower in Kimbelu village who grows and harvests apples throughout the year. He sells his a pples only in Kimbelu village. As a member of Kimbelu Apple Growers Association, Duran was voted as the ch airman of the association. In turn, he appointed James to be the treasurer on grounds that he is a fellow Catho lic who is trustworthy. The profits he gets from apple sales are divided among each family member, and Duran urges each of them to keep the portion on his behalf until the time when he needs it. Duran started making ap ple fruit jam in an effort to widen his sales. The jam he makes is packed in polyethene bags. The people who buy the jam have always complained of its poor quality and this has made him to record constant losses.

Tasks:

- (a) Advise Duran on how he can overcome his challenges and increase profits.
- (b) Assist Duran with a guideline on the steps to follow to come up with good quality fruit jam.

Item 2

In Moyo village, land is owned by elder clan leaders. Apio, a daughter of one late clan leader owns several plot s of land on the same village which were verbally given to her by her late father. She uses these plots of land t o grow groundnuts. Most of her undemarcated plots are claimed by some community members due to lack of clear boundaries. The soils in most of her plots are sticky with a high-water capillarity making it difficult to gro w groundnuts and other root crops. The groundnuts grown usually possess a purple coloration despite the app lication of enough phosphate fertilizers. When the soil samples from her plots were taken for laboratory analy sis, they indicated a red and pink coloration with the universal indicator.

Task:

- Using your competence in soil science, guide Apio to improve production in her groundnut business.

SECTION B — PART I (Answer one item from this part)

Item 3

Claire obtained cows from a trusted source and used them to establish a dairy farm. The cows had prominent humps and thick skins with a high concentration of sweat glands. She planted glycine, guatemala and lucerne all for feeding the cattle. The farm was established in Ngando village which is 350km away from the nearest v eterinary outlet. The site onto which the farm was located was soggy with many water snails. During hot sunn y days, Claire's cows scramble for the few available tree shades. The animals have numerous itchy scabs on t heir skin. The calves born at the farm are allowed to suckle milk from their mothers for only one day after birt h, after which they are bucket-fed for the remainder of their suckling periods. Claire serves cows one hour afte r showing signs of heat. Most calves born at the farm have bowed legs with swellings at the joints. She milks her cows using a plastic bucket and the milk always contains animal fur.

Task:

- Advise Claire on how she can overcome her challenges to improve the business.

Item 4

Mr. Tendo is a fish farmer in Buzibwera village. He rears tilapia fish due to its increasing demand in the local m

arkets. He established the fish pond in a swamp with sandy clay soils near a gazetted car washing bay. The ar ea is surrounded by a natural forest with big trees having buttress roots which he maintained on the site. He c onstructed the pond with vertically straight dykes with a view of preventing silting during the rainy season. Mr. Tendo usually feeds his fish early in the morning at 6:30am with a sinking pellet feed before leaving for his off ice work. The pond is surrounded by a mat of sedges and when stirred, a foul smell of pond water was felt at t he deep end of the pond. One day, some fish were observed dead and floating on the pond water with open m ouths and raised gill covers. He uses a dibber during harvesting when the average weight of fish is about 100 – 150g after 3 months. Mr. Tendo has made losses in fish farming and he is seeking for your advice.

NOTE: Under good management, tilapia fish attains the harvesting weight of 400g – 500g at seven (7) mont hs.

Task:

- Basing on your competence in fish farming, advise Mr. Tendo on how he can improve production in hi s fish farming business.

PART II (Answer one item from this part)

Item 5

Jude grows green pepper on his piece of land. He obtained the seeds for planting from Renzu Seeds and Agro -supplies. These seeds had a viability percentage of 96%. Jude prepared the land and pulverized the big soil cl ods. During the rainy season, he made a flat nursery bed which measured 3.3ft in width and 6ft in length. The nursery bed was established in the exact location where he had raised tomatoes the previous season. The se edlings were congested and most of them had small slender stem bases and were topping over. After four (4) weeks, the mature seedlings were transplanted into the main garden. Most of the seedlings had small tiny hol es allover their leaves, while others had a milky gummy exudate oozing out and had started wilting. The oxalis plants that were observed in the garden were controlled by hand-pulling. Plants that had fruits were bending an d their shoots entangled into each other. During harvesting, the plants that had red soft fruits were uprooted an d the soft red fruits were removed and put into a clean basket.

Task:

- How would you advise Jude to improve on the production of his green pepper business?

Item 6

Kigozi is a prominent farmer in Jungo village specialized in bean production. He obtained seeds for planting fro m his friends in the village SACCO, which he broadcasted in a seedbed prepared using force-up herbicides onl y. The big tree stumps were left standing and after germination, the field was covered with cowpeas which ha d been planted in the previous season. Kigozi maintained both the beans and cowpeas in the field. The beans developed watery lesions on the pods and some had U-shaped notches on the leaf margins. The field had nu merous and wide spaces between the plants despite following the recommended spacing. Kigozi harvested th e beans very early in the morning on a rainy day when the pod sutures had started opening. For the last three s easons, Kigozi has experienced a higher input than output and this has frustrated him to continue with this bu siness.

Task:

- As an agronomist, advise Kigozi on the best practices to improve bean production for high yields.

MOCK 3: Uganda Teachers' Examinations Scheme

Joint Mock Examinations — Agriculture, Paper 1 (527/1), Jul/Aug 2026

SECTION A: Soil Science and Value Addition (Answer all items in this section)

Item 1

Maria is vegetable dealer and recently she added Amaranthus (Dodo) on her vegetable stall. She periodically s prinkles some water over the vegetables while selling them in the sun rays. She opened a current account with the bank for her savings to gain interest. Customers have experienced their package breaking easily and spilli ng their goods. Most of her freshly harvested tomatoes have dry white powder to protect it since they are fresh from the field. Due to good harvest, the tomato fruits are not selling very fast on retails and whatever she has bought are soon going bad. Those in a vegetable dealer's group sold theirs in bulk and got over with profits. A f riend has recently told her that there is a ready market for tomato powder within the town areas, though she do esn't know how to make it. She is not gaining much from her business.

Tasks:

- a) Guide Maria on how to process tomato powder for sale in the area to gain more from it.
- b) What advice would you give to Maria to solve her other business challenges?

Item 2

Rita is a farmer who grows a lot of vegetables. In order to increase her production, she bought a nearby piece of land from a care taker and planted more cabbages. While watering her cabbages in the field after prolonged dry spell, she noticed that water would take long to sink into the soil and small water ways soon developed in some parts of the field after repeated rainfall. She was advised to do soil testing to improve the pH. She had a pH of 3 and was told to use sulphate of ammonia to boost its root growth. She applied fresh cow dung in the p lanting holes when transplanting her healthy cabbage seedlings to boost its root growth. Soon most of the see dlings wilted despite the soil being moist.

(Agronomist says cabbage grows well in soil with a pH of 6-6.8)

Task:

- Advise Rita on how to ensure profitable cabbage production (Your advice should include reasons).

SECTION B — PART I: Animal Production (Answer one item from this part)

Item 3

Lajony is a goat's farmer who recently started rearing them for meat production. He constructed the goats' hou se using freshly cut timber and poles and bought 5 males and 2 female goats to multiply them. During rainy se ason, the runoff water tend to gather around the structure despite being raised up. They are fed on tree branch es that are spread on the ground for them to eat with ease. He uses a rubber ring to castrate the mature male goats and the goats are dewormed after seeing the worm segments in their dung. While carrying out the regul ar spraying routine, the herdsman noticed one of the goats had difficulty breathing with its stomach swollen. When breeding, he uses the only quality male goat to mate with its female siblings and off springs on the far m. When harvesting for meat, he starves the goats on the eve of slaughtering so as to gain more weight at the age of 6 months. While cutting the meat into 4 large chunks, it usually has a lot of blood in the carcass. Custo mers rejected much of his meat because of its condition hence making losses.

(Experts in goats farming recommend that goats for meat harvesting mature at 12 months, browsing is for a t least 6 hours, deworming after every 3 months, flushing is done 2 weeks to breeding)

Task:

- Advise Lajony on how to improve the performance of his goats farming business.

Item 4

Tabu is a poultry farmer with great interest in meat and egg production. She used her garage with sealed ventil ators to improve on the security of her stock. During brooding, feeders were put on one side and drinkers the o pposite side of the room. Some chicks got choked with the litter despite the chicks being given enough chick mash, and some of the big chicks were seen running after the small ones within the room. Layers were given feeds spread within the feeders and a well-placed drinker had its surrounding litter wet despite filling it as req uired. The loose feathers in the house were collected once a month since some of the birds had their backs h aving few feathers. Most of the layers would struggle to rest on the drinkers and feeders after feeding and layi ng. Broilers were given adequate feeds for quick growth and sold off after 2 weeks. During egg collection, a fe w birds were seen incubating some eggs in the laying boxes. She is making losses from her poultry business.

(It is recommended that egg collection is done at least 3 times a day and packed in egg trays before being ta ken to the shop for sale.)

Task:

- Explain to Tabu the best measures she can use to succeed in her poultry business.

PART II: Crop Production (Answer one item from this part)

Item 5

Mr. Abudoni is a farmer who recently started coffee farming. He bought seedlings kept under shade until they were ready for transplanting from a local nursery operator with unclear source of his mother garden for cutting s as planting materials. After the overnight rain, he planted the seedlings in the morning hours on a clear sunny day in the planting holes measuring 15cm x 15cm which was dug 3 months ago towards the end of the rainy s eason. After sometime, most coffee trees were surrounded by other plants, a few of them wilted despite soil being moist. He then used a panga to carry out stumping of the coffee trees. Many shoots with immature berri es were seen bending reaching the ground during weeding. Abudoni hired people to help him harvest his coffe e in a basket and upon inspection, he observed green and red harvested berries and the harvested part of the garden had many berries scattered on the ground. He dried the harvested coffee on clean cemented ground be fore storage. Mr. Abudoni is not achieving the expected results of high-quality yields.

(The recommended spacing between planting holes is 2ft x 2ft)

Task:

- How can you help Mr. Abudoni to improve on his production?

Item 6

Clara is an Irish potato farmer; she selected the tubers with 1-2 buds from her previous harvest for planting. W hile planting, her friend advised her to make the planting holes randomly to cover the whole garden within a sh ort time. The potatoes that sprouted were very close to each other and some failed to sprout. Many other plant s with rhizomes/stolons grew in the garden and it was slashed. Since the soil was moist, most of them surviv ed. Afterwards, a few wilted potato plants were seen in some pockets within the field and towards maturity so me of the tubers had its parts clearly seen. The harvesting was carried out by pulling the tubers out of the soil after a dry spell and thrown to gather them in heaps. The harvested tubers had tunnels with some white insect s in it while others had bruises and softened parts.

(Spacing is required to be 30cm x 60cm.) Clara is not getting the production target that she expects.

Task:

- What advice would you give to Clara to realise good harvest from her production?

THE GOOD SHEPHERD

MOCK 4: Uganda Teachers' Examinations Scheme

Joint Mock Examinations — Agriculture, Paper 1 (Scoring Guide edition)

SECTION A (Value Addition)

Item 1

Mrs. Makubuya is a leading farmer among an expo of farmers from Namutumba district promoting agricultural products. She eradicated banana plants from her 3-acre land and established watermelon. She harvests 3 – 5 tonnes every week which she transports together with her brother's plastic and metal scrap on a cargo truck t o the city, and her selling point in the market is characterised by bad smell and flies. Mrs. Makubuya secured a contract to supply fresh melon to a hotel. In an attempt to maximize profits she started making melon juice for sale to restaurants and school canteens. She uses ordinary water/bottles which customers dislike, the juice is watery and sometimes smells. She wishes to buy a commercial blender but her capital is limited. Mrs. Makub uya approached the Bank manager with only an LC1 introductory letter confirming her residence to open up a b ank account, but it failed.

Task (a):

- Design the guiding document/steps for making water melon juice to sell to her customers.

Task (b):

- How would you advise Mrs. Makubuya to achieve the best from her project?

Scoring Guide — Item 1 (Value Addition)

How to make watermelon juice:

- Put on protective gear like gloves, aprons, and headcaps, among others for safety and to prevent cont amination.
- Gather the materials and equipment needed to carry out the process; for example, fresh watermelon, a knife, water, a juicer/blender, and a glass.
- Wash the watermelon to remove any dirt.
- Peel the watermelon to remove the epicarp.
- Chop the peeled watermelon into small pieces to ease the blending process.
- The chopped pieces are placed into the blender or a juicer to crush them so as to obtain juice.
- Strain/sieve the juice to remove impurities.
- Add a little sugar to sweeten the juice.
- When ready, serve fresh or pack the juice for easy storage and selling.
- Carry out branding for easy marketing.
- Refrigerate the juice to extend its shelf life.

Task (b) — expected responses:

- She transports her melons on a truck carrying plastic scrap to the city: She should transport her melo ns to the city separately from the plastic scrap to avoid damages.
- She tips her watermelon when offloading at her selling point/stall: Watermelons should be gently off-l oaded by hand from the truck to avoid damaging them.
- Failure to meet the daily melon demand for the hotel and breach of the contract: She should call upon other melon producers to cooperatively market their products to meet the daily melon demand at the h otel.

THE GOOD SHEPHERD

- Her fruits are often rejected by customers due to flies and bad smell around her selling point in the m arket: She should keep her melons in cold conditions to extend their shelf life and avoid bad smells fr om rotten melons that attract flies.
- She went with only an LC1 introductory letter confirming her residence to open a bank account and it f ailed: She should carry all the necessary documents such as a National ID, LC1 introductory letter, cur rent passport-sized photos, and the application fee to open up a bank account.

Item 2

Mzee Kamwaaka purchased an acre of a steep land along Ngongora hills for growing Okra. The crop performs well in soils with pH ranges between 4.8 – 5.5. The bought land is entirely occupied by wondering jew (Comme lina sp) which is an alkaline tolerant weed. Part of the land has clearly cut channels running down the slope. T he same land is being claimed by a neighbour whose crops on one side show purple coloration along the leaf margin regardless of the good management practices. Some part of mzee's land possesses hard and crusty s urfaces while the lower end is entirely covered with nut grass which is a water loving plant. Mzee has failed to meet his target.

Task:

- Advise mzee Kamwaaka on how to manage his land as to have high productivity of his okra project.

Scoring Guide — Item 2

- Soils with Alkaline pH which do not support okra growing: Mzee Kamwaaka should apply acidic fertiliz ers to lower the pH to a range between 4.8–5.5 that favours okra production.
- Clearly cut channels running down the slope (rill erosion): Mzee Kamwaaka should construct contour bunds to intercept the running water and prevent erosion.
- Land being claimed by neighbours: Mzee Kamwaaka should process a land title to prevent land disput es.
- Land possesses hard and crusty surface: Mzee Kamwaaka should apply organic manure to improve t he soil structure.
- Poor drainage on the lower end: Mzee Kamwaaka should construct drainage channels to lead away ex cess water.
- Purple coloration: Apply phosphatic fertilizer to increase soil nutrients to meet crop demands.

SECTION B — PART I: Animal Science

Item 3

Mr. Bwamiko, a farmer in Nakasongola District has been raising cows, goats and pigs on his farm. On visiting an Agricultural exhibition at Lugogo, he was given an idea by his fellow farmers to add a poultry enterprise on h is farm so that he can diversify his economy. He decided to purchase 500 one-day old chicks from that exact f armer because he incubates his own eggs at his farm using a simple incubator. He decided to pick up his chic ks in an enclosed box to cut the transport costs; on reaching the farm some of the chicks were dead. On the d ay of arrival, chicks were observed eating litter and drinking glucose solution he prepared in well-cleaned drink ers as he was instructed. He provided one 7W LED electric bulb which he placed at the extreme corner of the brooder house. After one month, he transferred his chicks to the deep litter house and as time elapsed the litte r was seen clamped together with brown-whitish moulds growing on it and producing a bad smell. Some birds pass out faecal matter containing long cylindrical organisms. Mr. Bwamiko used pieces of wood and old cloth es to cover the windows of the poultry house. He used 4 automated drinkers which were placed in each corne r of the poultry house. He always calls villagers to assist slaughter and dress the birds. They normally do this u nder a tree shade near the poultry house. Due to high demand for his products in the near-by trading centre, M r. Bwamiko often sells his broiler birds at 3 weeks.

THE GOOD SHEPHERD

Task:

- As an agricultural extension expert, write a comprehensive and technically advisory paper to guide Mr. Bwamiko on how to rectify his poultry enterprise.

Scoring Guide – Item 3

- Purchasing one-day-old chicks from a fellow farmer: Mr. Bwamiko should buy chicks from certified s uppliers to get high-quality poultry.
- Picking up chicks in an enclosed box: Mr. Bwamiko should carry (transport) chicks in well perforated boxes to allow proper aeration and avoid suffocation of chicks.
- One-day-old chicks observed eating litter: Litter should be covered with brooder paper or boxes to prev ent birds from eating/ingesting litter and pathogen attack.
- One 7W LED bulb placed at one corner of the poultry house: He should use infrared lamps placed in th e centre of the poultry house to provide adequate warmth to the growing chicks and control overcrowd ing of chicks in the corner.
- Clamped and smelling litter with growing moulds: He should regularly rake/replace the old litter to avoi d disease outbreaks.
- Faecal matter containing long cylindrical organisms: He should carry out deworming of birds to preven t development of internal parasites.
- Use of pieces of wood and old clothes to cover the windows: He should use chicken wire mesh for pr oper aeration in the poultry house.
- Used few automated drinkers: He should provide an adequate number of drinkers that are well-distrib uted to avoid competition for drinking water.
- Slaughtering is done under the tree shade near the poultry house: Slaughtering should be done on a w ell-cemented and slanting floor to prevent soiling of the carcass.
- Selling his broiler birds at 3 weeks: Broiler birds should be sold for meat from 6 weeks of maturity for good quality meat.
- Villagers assisting with slaughter.
- Dead chicks on arrival.

THE GOOD SHEPHERD

Item 4

Kakulu, a youth leader in Masindi District, received a government grant under Smart Agriculture to set up a co mmercial goats farm. He resourced for the breeding stock from his friend who works in a goat specialized aba ttoir. After a week of arrival, the goats started starving as pastures got exhausted and some died off before th e month elapsed. Kakulu rears his goats under stall feeding systems as advised by the district production offi cers. His animal structure has many potholes where liquid manure collects and attracts flies. Occasionally, yo ung goats suffer from accumulation of gases in the rumen which is claimed to be associated with the feeding practice. Attendants give animals water once a day after coming from watching premier league football game s. Sometimes Kakulu fails to supply adequate amounts of goats' milk to his customers due to kids suckling th eir mothers in the night. Many of the adult goats have deformed and overgrown hooves which give them a poor posture when moving. He once found blood around the farmland and on rounding up his animals; he discovere d that some kids were missing. Culling is carried out every two (2) months and slaughtering is done in the near -by garden behind the animals pen. Customers complain of the he-goat smell of the carcass and contaminatio n with stomach content. Kakulu is worried as four years down the road he has not registered any profit.

Task:

- As a District Production Officer, advise Mr. Kakulu on how he can achieve high productivity from his g oat project.

Scoring Guide – Item 4

- Resourced for breeding stock from his friend who works in a goat specialized abattoir: He should resource for breeding stock from certified suppliers to get high-quality goats.
- Goats started starving as pastures got exhausted: He should establish enough pastures before the introduction of goats to prevent starvation of goats.
- Animal structure has many potholes where liquid manure collects and attracts flies: He should seal off the potholes with concrete to maintain good sanitation/hygiene so as to prevent outbreaks of diseases.
- Goats suffer from accumulation of gases in the rumen: He should feed goats on partially wilted pastures to prevent bloat.
- Giving animals water once a day: He should regularly provide his goats with clean, adequate water to quench thirst.
- Kids suckle their mothers in the night: He should construct kid pens to isolate the kids from their mothers.
- Overgrown hooves which give them poor posture when moving: He should carry out hoof trimming to prevent lameness and give animals good posture when moving.
- He found blood on the farm and, on rounding up his animals, some kids were missing: He should construct a perimeter fence to prevent attacks from predators.
- Slaughtering is done in the nearby garden behind the animal pen: He should construct a well-cemented slaughter place to avoid soiling of the carcass.
- The he-goat smell of the carcass: He should carry out castration of male goats to control the unpleasant smell in the he-goat carcass.
- Contamination with the stomach content: He should starve the animals for hours before slaughtering to prevent contamination of the carcass with stomach content that can lower the meat quality.

THE GOOD SHEPHERD

PART II: Crop Science

Item 5

Ssebunya graduated with a master's degree in Social Sciences. On his graduation ceremony, the guest of honour was his aunt from Sweden who promised him five (5) dairy goats. He started establishing Congo signal grass 6 months before, in preparation to receive the dairy goats. He sourced pasture seeds from a friend who also deals in the same business. He prepared the seedbed and planted the seeds immediately using a seed rate of 2kg/ha. On germination, some seedlings were covered up with hard and large soil lumps. After one week it was observed that most pasture plants exhibited yellowing and premature leaf fall. There were strong thorny plants that were growing past the height of established pasture. Some empty spaces were also observed in the pasture land after establishment. Ssebunya had one water trough located at one end of the pastureland. He started rotational grazing on his pasture one month after establishment. He prepared hay from the excess pasture 3 weeks after flowering to avoid wastage. Ssebunya realized low pasture output in terms of quantity and quality, the animals that are grazed on it are also of poor quality. Ssebunya is confused; he does not know what to do.

(Research shows that Congo signal grass is planted at a seed rate of 40 kg/ha, and harvested at the onset of the flowering stage.)

Task:

- Advise Mr. Ssebunya on how he can improve performance of his pasture plants. (Your advice should have reasons.)

Scoring Guide – Item 5

- Sourced pasture from a friend: He should obtain the pasture seeds from certified suppliers to ensure high-quality pasture production.
- Used planting rate of 2 kg/ha: He should plant Congo signal pasture seeds at a seed rate of 40 kg/ha for optimum resource utilization.
- Seedling covered with hard, large soil lumps: He should carry out secondary tillage (harrowing) to attai n a fine tilth for proper seed germination.
- Pastures observed exhibiting yellowing and premature leaf fall: He should apply nitrogenous fertilizers such as Urea (spray using recommended chemical) to provide nitrogen for the growing pasture plants.
- Strong thorny plants growing past the height of established pasture: He should carry out weeding to pr event competition for growth factors between weeds and pasture crop.
- Empty spaces were observed in the field after establishment: He should carry out gap filling for optim um land/resource utilization.
- Water troughs established at one end of the pasture land: He should evenly distribute the water troug hs on the pasture land to prevent over-stamping and overgrazing in areas with water troughs.
- Rotational grazing on pasture after one month: He should carry out rotational grazing after 4 months to promote pasture re-establishment and allow regrowth of pasture plants after grazing.
- Preparing hay from excess pastures 3 weeks after flowering: He should prepare hay from excess pas ture at the onset of flowering to obtain high-quality pasture in terms of nutritional value.
- Planting seeds immediately after seedbed preparation: Time should be allowed for the organic materi als to decompose and provide organic matter before planting.

Item 6

Jwenge grows cassava since it is a staple food in Acholi. In late May 2026 he planted cassava cuttings that h e obtained from the nearby bush land. The planting was after the rains because he previously had challenges with waking up early on rainy days. The planting holes were dug 5 metres apart. Some cuttings established wh ile others did not, but Mr. Jwenge did not bother because he had another plantation doing well in the next villag e. Couch grass was manually uprooted from the field; some cassava plants had mottled leaves and a little stu nt while others had clusters of small white insects on the stems. Some tubers were visible above the ground a nd during harvesting many were cut accidentally because of the high demand for cassava flour in the region. He harvested his crop in 120 days after planting. Despite the fact that cassava prices were high, Mr. Jwenge d id not realize a profit.

Task:

- As an agronomist, write a key note address advising Mr. Jwenge on how best he can benefit from his project.

Scoring Guide — Item 6

- Planted cassava cuttings obtained from a nearby bush: He should obtain planting materials from certi fied suppliers/sources to obtain high-quality cassava.
- Planting was after rains: He should carry out early planting to allow plants to obtain sufficient moistur e for optimum growth before the onset of the dry season.
- Planting holes were dug 5 metres apart: He should carry out proper spacing to ensure maximum resou rce utilization and optimum plant population.
- Some cuttings established while others did not: He should carry out gap filling for maximum land use and optimum plant population.
- Couch grass manually uprooted: He should spray with a recommended selective herbicide to avoid co mpetition for growing factors/to prevent destruction of the tubers by the rhizomes.
- Mottled leaves and a little stunt: He should uproot and burn the infected plants to control the spread o

f the disease.

- Small white insects on the stem: He should spray with recommended insecticides to kill whiteflies.
- Tubers visible above the ground: He should carry out earthing up to avoid exposure of tubers to rodent s and sunshine which lowers its quality.
- Harvesting is done at 120 days after planting: He should harvest his cassava at 6 months and above t o ensure high quality and quantity of tubers.
- Accidentally cutting tubers during harvesting: He should use recommended tools to reduce cuts.

THE GOOD SHEPHERD

MOCK 5: Board of Regional Mocks Association

Agriculture, Paper 1

SECTION A: Soil Science and Value Addition (Answer both items from this section)

Item 1

Mr Okumu discovered that there was an increase in sugar related diseases among Ugandans due to excessive consumption of carbohydrate foods. He decided to set up a beef farm in Tororo in order to increase meat production which is a huge source of proteins that may help reduce the high carbohydrate intake. Okumu starves his animals for 2 hours prior to their slaughter. The animal necks are left lying flat after slaughter which leads to incomplete bleeding making the meat dark. A kilogram of fresh meat goes for 10,000/= while a stick of roasted meat is sold at 5,000/=, one kilogram of meat makes 5 sticks of roasted meat. Okumu picked interest in selling roasted meat though he has no knowledge on how to produce good quality roasted meat. Okumu transports his meat to the market using open containers, reaching the market when the meat is soiled. Okumu also keeps his money in a small box buried in the kraal on his farm. He went to the village Saving group to request a loan but he was denied since he is not a member of the saving group.

Task:

- (a) Write a message to Mr Okumu advising him on how to produce good quality roasted meat.
- (b) What advice would you give to Mr Okumu in order to solve the challenges?

Item 2

Mr. Katungi would like to establish an avocado plantation on his steep fragmented land. The lower part of his land has a lot of stagnant water. The soils in the upper part of the land are loose and very porous. Big trucks used the middle part of the land when ferrying murram from the neighbour field. The avocado trees have poorly developed roots, making Mr Katungi worried.

Task:

- Design a leaflet to advise Mr Katungi on how to make his soil more suitable for avocado growing.

SECTION B — PART I: Animal Production (Answer only one item from this part)

Item 3

A cattle keeper in Kayanja village rears Zebu cattle for milk production. Part of the roof of the calf pen was blown off by wind. His Zebu animals entirely feed on forage and animals are given soapy water after washing clothes. His animals are randomly mated by the neighbour's bulls during communal grazing. Animals are always rubbing themselves on walls of farm buildings; at night some escape and damage other people's crops. He carries out steaming up two days to calving. He uses a cup for administering oral drugs. He milks lactating cows at different hours of the day near the garden of onions. Customers have abandoned his milk in favour of the neighbour and he is confused.

Task:

- What advice would you give to the farmers in Kayanja in order to increase the productivity of their farm animals?

Item 4

Mr. Kajoba is a fish farmer in Baale village. He rears tilapia fish because of their demand. He established the fi

sh pond in a seasonal swamp which has water fluctuations. He poured the fish fingerlings in the pond during stocking. The pond is in an area with many entry points for predators. The screen of the outlet pipe has a wide gap for proper outflow of water. He applied lime even when the pH of the pond water was 9.5. A lot of algae ar e observed on the water surface. He feeds his fish once a day. Some fish are preyed on by rats from a nearby bush. He uses a sharp stick to harvest fish at the age of 2 months for selling. He has made losses in his busi ness.

(Fish does well in water pH between 6.5–9.5 and matures at 5 months onwards.)

Task:

- Advise Mr. Kajoba on how he can improve on the fish production.

PART II: Crop Production

Item 5

Mr. Niwagaba is a prominent business man in Uganda. He operates a mobile business in and outside the coun try. Lately he picked interest in cabbage growing. He established a nursery bed on a low-lying land that usually floods. He covered the nursery bed for two weeks with a thick layer of fresh grass and, upon opening the nurs ery, the seedlings were long with weak stems. Niwagaba carried out pricking out two days before transplantin g. He used a hoe for removing seedlings during transplanting. He transplanted cabbage seedlings at 1pm on a sunny day. The cabbage plants have powder-like substances on their leaves. He weeds by spraying non-selec tive herbicides. Some plants had small heads since they were growing under trees. He harvested cabbages fo ur weeks after transplanting and left the plant residues until the next season.

Task:

- What advice would you give to Mr Niwagaba in order to increase the productivity of his business?

Item 6

Mande is a famous maize farmer in Kalongo village. He tills his land using a blunt hoe. He plants his maize on e month after the rains have started. He places five seeds in each planting hole. These seeds were certified a nd all germinated. The planting holes were spaced 2cm x 11cm. At knee height stage, maize plants had holes i n the stems and leaves with internal contents eaten. He sprayed his crops to control pests in windy weather. T owards flowering, the leaves of some plants were having yellow stripes along the veins with orange spores on the lower sides. He harvests his maize when some seeds have started germinating from their cobs, using a sl asher.

Task:

- Suggest the ways how Mande should act to have a successful maize production.

THE GOOD SHEPHERD

INSTRUCTIONS TO CANDIDATES:

This paper consists of **six** *examination items. It has* **two** *sections;* **A** *and* **B.**

Section **A** *has* two ***compulsory items.***

Section **B** *has* two *parts;* **I** *and* **II.** *Answer* **one** *item from each part.*

Answer **four** *examination items in all.*

Any additional item(s) answered will not *be scored.*

All *answers* must *be written in the Answer booklet(s) provided.*

CamScanner

SECTION A

*Answer **all** items in this Section*

VALUE ADDITION AND SOIL SCIENCE

Item One

Mr. Borokoto is a butcher and proprietor of **Borokoto Meat Products Processors (BMPP)**. During a recent meeting of the meat vendors' SACCO, all the members were talking at the same time. Some of the beef sausages he produces leak meat from their casings. In addition, the beef he packages for sell contain excess fat. Mr. Borokoto recalls the names of his debtors and the amounts they owe from memory. Some of his employees have also failed to open bank accounts because they could not provide the required documents to prove their nationality.

Tasks:

(a) Develop a step-by-step set of guidelines Mr. Borokoto can follow to produce high-quality beef sausages.

(b) Write a message to sensitize Mr. Borokoto and his employees on good business practices and effective ways to increase income and reach the youth market.

THE GOOD SHEPHERD

Item two

Enid grows cabbage in the plains of Kabale District. She purchased a diammonium phosphate (DAP) fertilizer whose instructions never instructed how and when to apply it, which made her wonder why. Her soils were observed to be light reddish in colour with numerous rill lines crossing from one end to another. In order to expand her land, she purchased customary land from her immediate neighbour, and the two made an agreement. The soils were later found to be highly alkaline, yet cabbages thrive well in slightly acidic soils of about pH 6.5.

Task:

Explain to Enid the best practices that would help her make her soils productive and also benefit from her land.

CamScanner

SECTION B

PART I:

ANIMAL PRODUCTION

*Answer **one** item from this part.*

Item three

Okello is a prominent goat farmer in Amuria District. Early in the morning, some goats are often seen standing in the pasture field. The kraal where the goats stay is often surrounded by water for more than eight hours after rains. All his equipment, including milking tools, spades for manure collection, and hand hoes, are stored together in the same place. During milking, some goats kick the milk bucket, causing milk to spill. To reduce friction and protect the teats, Okello applies cooking oil on his fingers while milking. To control ticks, goats are sprayed by sprinkling acaricides using a broom. Several goats become pregnant at different times, raising concerns about the bucks involved. When the goats were introduced, pastures containing the required nutrients for dairy goats were planted. In some mature goats, whitish cylindrical organisms are often seen in the dung. Okello's farm is also located in an area frequented by stray animals, including other livestock and dogs that roam freely around the land.

Task:

What advice would you give to Okello to help him sustain his goat-rearing enterprise and enhance productivity?

Item four

Ssemaganda is a tilapia fish farmer operating several earthen ponds in a rural area. He has recently noticed that fish growth is uneven across the ponds, with some ponds producing small-sized fish even after long rearing periods. He also observes that some ponds have excessive aquatic plant growth covering the water surface, while others have poor water quality with an unpleasant smell. During feeding, a lot of feed remains floating until it rots. At times, fish are difficult to harvest because they escape through the net. In addition, some fingerlings show signs of stress shortly after stocking them into the pond.

THE GOOD SHEPHERD

CamScanner

Some younger fish also have bruises and damaged gills and skin. Ssemaganda is also unsure about the correct timing for harvesting tilapia to achieve maximum market value.

Tilapia are typically harvested after 6 to 9 months, when they reach a marketable table size of 250–500 grams.

Task:
Recommend appropriate management practices Ssemaganda should adopt to improve fish production in terms of both quality and quantity.

PART II

CROP PRODUCTION

*Answer **one** item from this part.*

THE GOOD SHEPHERD

Item five:

A youth farmer, Mumbere, in Kabale district secured a market for fresh tomatoes which should be grown and raised organically. They selected the Ego F1 tomato variety, which grows best in low-altitude areas. This variety is known to be highly susceptible to tomato blight. Mumbere established the nursery bed during the mid-rainy season. At six weeks, he transplanted the seedlings by pulling one at a time out of the soil and planted them at a depth of 1 cm into the soil. In a row of 45 m, 90 tomatoes are expected according to NARO and Mumbere attempted to use 90 cm spacing from one tomato plant to another, leading to overcrowding. A month later, insect eggs were observed at branch junctions of the tomato plants. Nevertheless, some plants managed to grow to full maturity, yielding tomatoes that were a mix of fully green and some pale reddish. The tomatoes were harvested when fruits were at different maturity stages. Mumbere harvested all the tomatoes by breaking off the branches that held the fruits.

CamScanner

Task:
Advise Mumbere on the appropriate crop production practices he should adopt to improve the quality and yield of his tomato crop.

Item six

Nsadu started an elephant grass project on one acre of land in Buyende District to feed his dairy animals and sell the excess forage. He planted elephant grass splits, some with visible buds and others without. The grass stems had red-lined bruises visible on their nodes. Many stood crooked and bent over. Some shoots emerged between big soil clods, while others barely surfaced. Growth was slow. Even with regular weeding and mulching, his grass remained immature as neighboring farmers harvested theirs within the same period. The ground stayed dry and cracked for most of the season. Among his crop, some old stalks started sprouting again. He tried harvesting the elephant grass by cutting using a hoe, but the attempt damaged several grass bunches. After inspecting the garden one morning, his hands were bruised with small cuts from the elephant grass leaves.

Task:

Suggest practical solutions Nsadu can adopt to increase his elephant grass yield and productivity.

Turn Over

SECTION A

SOIL SCIENCE AND VALUE ADDITION

Respond to **both** items from this section.

Item 1

Joan is a tomato farmer who produces a large quantity of tomatoes on her farm. She packed the tomatoes into wooden crates and left them in the sun for the entire day. By the evening, some were observed to have wrinkled surfaces. She sorted the tomatoes and stored them, on the following day, some had developed molds and soft surfaces. Joan learned that there was a high demand for tomato sauce in her community. She used the available equipment to make the product. However, the customers complained that it contained dark flecks. The profits obtained are used for plaiting hair and repairing her finger nails. She consistently lacks clear information on tomato cultivation and management, and as a result she is failing to achieve her goals. Her fellow tomato farmers, who are members of the Twekembe Farmers Association, receive training every season on tomato growing and management. She is now worried about her business and is seeking your advice on how she can improve the marketing of her tomatoes.

THE GOOD SHEPHERD

Task:

(a) Advise Joan on how she can improve the marketing of the tomatoes from her farm. *(Include reasons for your advice).*

(b) Give guidelines on how Joan can come out with good quality tomato sauce.

Item 2

Peter established rice on his gently sloping land that he acquired from his parents. He claims that the land belongs to him, though it has no official documentation. The land is characterized by numerous shallow trenches running down the slope. The soil is brownish with large particles widely spaced and it dries out very fast. The growing plants appear stunted and yellowish. Peter is worried about the status of his crops and has approached you for possible remedies. *Rice grows well under high soil moisture.*

Task:

Suggest to Peter the remedies he can take to address his worries. *(Your suggestions should include reasons).*

SECTION B
PART I:
ANIMAL PRODUCTION

Respond to only **one** item from this part.

Item 3

Rita rears New Zealand white rabbits for meat production. She established rabbit hutches and finished the floor with concrete. Every morning, she realized that the floor was ever damp. She placed wire mesh on the sides half way and finished the remaining part with plywood. She sourced rabbits from the neighbor's farm and introduced them into the hutches. Her rabbits are constantly shaking their ears and scratching their bodies with their claws. At times, they observed with wounds of their claws all over their body. The rabbits are fed plenty of sweet potato veins on a daily basis. She woke up one morning and observed that the rabbits were producing stained faecal matter and abdominal distensions. She slaughters rabbits and produces only two kilograms of meat per rabbit. The meat obtained contains smell of strange plants. The rabbits are slaughtered from under trees surrounded with many strange plants. Rita complains that she is not getting enough from his farm.

(Research data shows that New Zealand white rabbits slaughtered at 6-7 months produce 4.5-5.5kg of meat).

THE GOOD SHEPHERD

Task:

Explain how Rita can ensure increased productivity on her farm.

Item 4

Deborah rears chicken on a large-scale using battery cage system. She owns a hatchery unit where she hatches the eggs at the farm. She picks eggs at random for incubation. Upon inspecting the incubated eggs after 7 days, it was observed that some eggs had their embryos sticking on the shells. The hatched chicks are transferred from the incubation unit to the brooding house whose inner corners are round. On the day of arrival, the chicks were observed feeding on the litter. After brooding, the growers were moved to the growers' house whose floor was rammed with concrete and covered with coffee husks. She uses a stocking rate of 8 birds per m^2 for layers. The birds always have inability to stand and some have wounds on the cloaca. The house contains a foul smell as chicken droppings are only removed once a week. Some birds have small organisms attached to their eyes. The collected eggs are cleaned, piled in a box and stored in a cool place. The

broilers are currently sold at 18 weeks. She says that the business is performing below her expectations.

(Available information shows that broilers should be sold off at 5-7 weeks of age and stocking rate for layers in battery cage system should be 5-6 birds per m^2).

Task:

Guide Deborah on how to improve the performance of her poultry business.
(Your guidance should include reasons).

PART II: CROP PRODUCTION

Respond to only **one** item from this part.

Item 5

Mafabi established a hydroponics system for growing tomatoes. He used a nutrient film technique system having metallic tubes to supply nutrient solution and hold plants. The flow of the nutrient solution was irregular because it was done manually due to the system's long distance from the power source. He used fine clay soil to hold plants in the grow trays. The established plants possessed soft textured roots with slippery coating. The distribution pipe and reservoir contained greyish surfaces and blocked at certain points. The reservoir was losing nutrient solution which required daily refilling. The nutrient pump was observed receiving low power currents, even though the power source was in good working conditions. The established tomatoes were bushy. The tomatoes were harvested by removing the whole plants from the system and collecting fruits in black polythene bags. Mafabi did not get the high profits he anticipated and is wondering what he can do to maximize profits as he embarks on a second season.

THE GOOD SHEPHERD

Research data shows that plastic tubes are more preferred in hydroponics system.

Task:

Explain to Mafabi how he can maximize profits from his hydroponic gardening in the second season.

Item 6

After realizing the high demand for maize, Mukasa decided to establish a maize plantation in his garden. He acquired maize seeds from a certified agricultural shop and mixed them with some seeds from his store to reach the quantity he needed. He cleared the seedbed using a panga with a broken handle. He planted the maize seeds on the same day he finished to ploughing using a seed rate of 5 maize seeds per hole. After establishment, unclear plants were growing taller than the maize crops and stems contained holes bored on all sides. Some plants dried up leaving empty spaces in the garden while some plants had their roots exposed on the surface. He harvested the maize when the husks were still green on a rainy day. Mukasa now complains that he is not getting the yields he expected and has approached you for advice. *A recommended seed rate should be at least 2-3 maize seeds planted per hole.*

Task:

What advice would you give to Mukasa to benefit profitably from his maize project. *(Your advice should include reasons).*

INSTRUCTIONS TO CANDIDATES

This paper has six examination items. It has two sections A and B.

Section A has two compulsory items.

Section B has two parts; I and II. Answer one item from each part.

Answer four examinations items in all.

Any additional item(s) answered will not be scored.

Answer sheets shall be provided.

SECTION A

SOIL SCIENCE AND VALUE ADDITION

Item 1

John cultivates crops on five small, scattered plots of land located within the same area. He reports that in one of the plots, his maize was slashed down by a neighbor who claims ownership of the land.

He has noticed that some of his plots have compacted soils, while others are overly plastic when moist. The maize plants in his plots are excessively vegetative, producing poorly filled grains.

To control erosion on one of his steeper plots, John used freshly cut grass as mulch. Soil tests revealed that the soil temperature in this plot is 33°C, with poor aeration. Most crops, including maize, thrive at soil temperatures between 22°C and 27°C.

John further complains that he has not benefited from his farming efforts over the last six years.

Task:

Write detailed recommendations to help John maximize profits from his farming activities.

Item 2

Kasukuwere is a leader of a small coffee farmers' cooperative in the Mpinyo community. She appointed her cousin Jane as the treasurer.

After harvesting coffee, she packs both green and red berries in sacks and transports them to her home for sun-drying. During drying, the berries are spread on clean papyrus mats. At night, she covers them with other mats to protect them from rain.

Once dry, the coffee is packed in damp gunny sacks and transported in open trucks to the market. The coffee is stored in a cracked and rodent-infested store.

Part of the money earned is stored in a metallic locker in her office, while the rest is used to repay a loan from a local moneylender. Since starting this business, Kasukuwere has consistently operated at a loss.

Task:

Advise Kasukuwere on how to improve the profitability of her coffee business.

Apex Examination Council
THE GOOD SHEPHERD

SECTION B

PART I – ANIMAL PRODUCTION

Item 3

Mr. Oguzu rears goats on his farm. During the rainy season, runoff water flows through the goat house, and stagnant urine has been observed on the floor.

Leftover feed is found scattered on the floor where six kids are housed. At 12 weeks, Mr. Oguzu performs castration on the young goats to encourage faster growth.

The adult goats graze in the evening in nearby natural pastures. Some goats show hair loss and crusty patches on their ears. During milking, Mr. Oguzu was observed stripping the teats. The milk yield on the farm is low.

Task:

Provide practical advice to Mr. Oguzu to help him improve productivity and profitability from his goat enterprise.

item 4

Minu is a rabbit farmer (cuniculturist) in Mukono District. She keeps her rabbits in multiple hutches and feeds them exclusively on grass collected from a nearby dumpsite. She gives them pooled water for drinking.

The hutches are placed directly on the ground and are exposed to direct sunlight. The young rabbits (kits) were found curled up together on wooden floors.

After feeding and watering, she transfers feeders and drinkers from one hutch to another. Some adult rabbits have been observed wheezing and showing signs of muscular tremors. Rabbits are only sold once every 11 months.

Task:

As her advisor, suggest ways Minu can increase the productivity and health of her rabbits.

Apex Examination Council
THE GOOD SHEPHERD

PART II – CROP PRODUCTION

Item 5

Jwiji grows cassava. After the onset of rains, she tilled her land and used cuttings from the previous season's harvest. She dug 40 cm long furrows and applied urea fertilizer before planting.

The cassava was planted too densely, and in some areas, the cuttings failed to establish. Couch grass was manually uprooted from the field. Some cassava plants have mottled and stunted leaves, while others show a cluster of small white insects on the stems.

Several tubers were visible above the soil, and during harvest, many were accidentally cut into pieces.

Task:

Advise Jwiji on best practices to improve cassava yields on her farm.

Item 6

Ntwiga is a cocoa farmer in Bundibugyo. He transplanted 14-month-old cocoa seedlings at a spacing of 1 meter apart.

Some of the young trees appear bent and dry, despite sufficient soil moisture and no signs of disease or pests. Mature cocoa trees have thick canopies, and a sticky, sweet fluid is seen on most of their leaves.

Many cocoa pods are black, soft, and mushy. During harvest, Ntwiga picks both green and orange pods. He has been experiencing consistent losses.

Task:

As a crop science student, advise Ntwiga on how to manage and improve production in his cocoa plantation.

End
