KAGADI JOINT MOCK EXAMINATIONS CONSULT
GEOGRAPHY 273/1 SCORING GUIDE

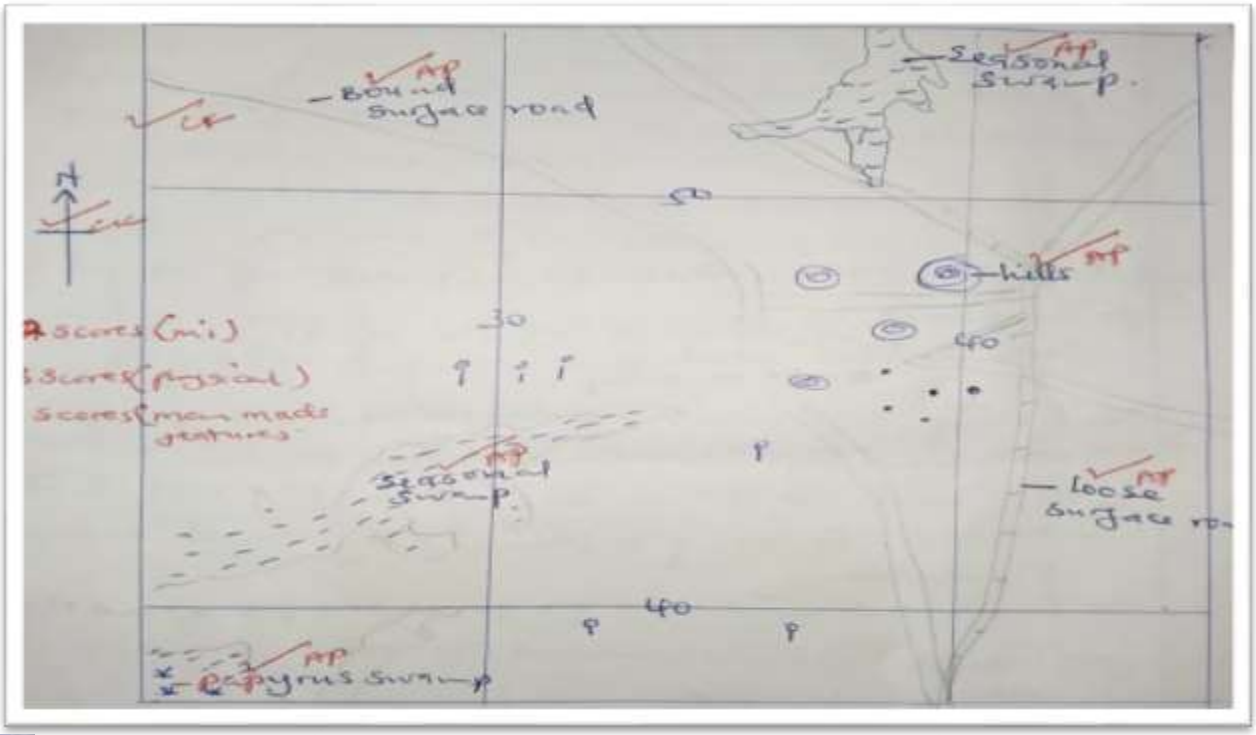

CONSTRUCT:
Appreciates the dynamic inter-relationships between the physical and human environment using geographical tools, techniques and methods to investigate, analyse and represent them.

N.B. A guide will help the user to judge the work of a learner fairly not only to stick on words but to understand the knowledge the learner is using and application of that knowledge in solving different problems to different items.

SECTION A

Item 1(a)

A SKETCH MAP OF NAKASONGOLA SHOWING DIFFERENT FEATURES.

KEY

Seasonal swamp

Papyrus swamp

Hills

Huts

CK - 1 score for tittle.
CK - 1score for key.

CK – 2scores(Mi), AP- 3scores (Physical features), AP- 3scores (Manmade features)

Note:

- Don't award any score if a learner has not put the name of tittle (**Nakasongola**).
- Learners **must** mark and name on the sketch drawn.
- The sketch should have a real shape and neat.
- On a guide any additions are allowed.

(b) There were many bound surface roads heading to Wakibambo mission, so the distance covered would depend on the bound surface road the candidate considered.

(c)(i) Activities which can be carried out

- Transport evidenced by the roads such as loose surface road, bound surface road, foot path, etc. Quote on a map.
- Fishing evidenced by seasonal swamps around Nalukoma, Kikoko, kasiti, etc.
- Art and craft evidenced by papyrus swamps.
- Arable farming evidenced by rural even population.
- Tourism evidenced by landscape around Nakasongola.
- Trade evidenced around the road junction at Nakasongola.
- Education evidenced by schools.
- Manufacturing and processing evidenced by the ginneries near Nakasongola mission.

N.B Activity should have evidence on a map. $\binom{\text{Activity (CK)}}{\text{Evidence(AP)}}$ **Any 2x2 = 4 scores.**

(c) (ii) Relationship between relief and land use.

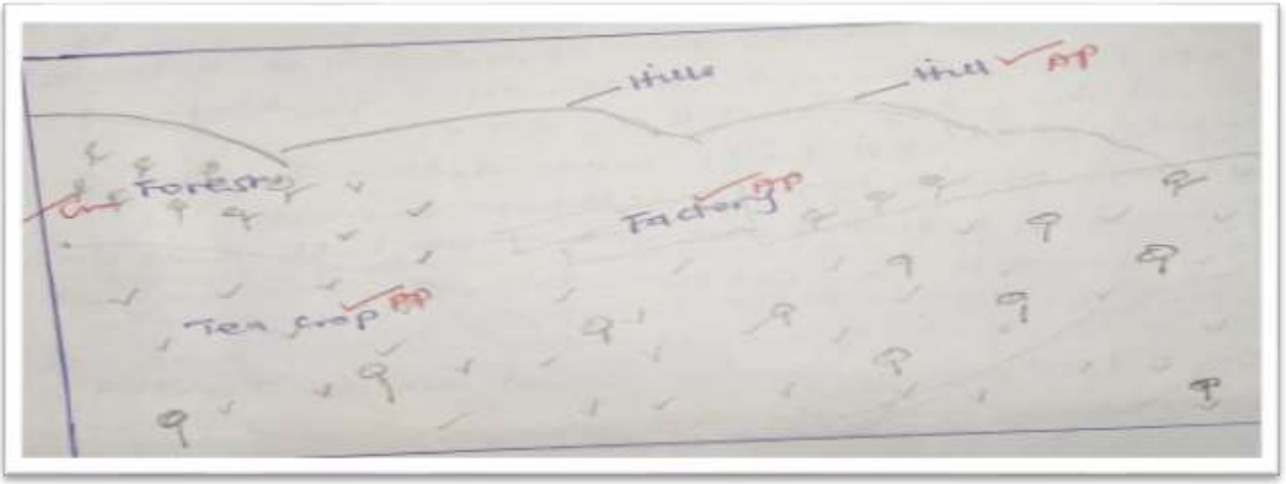

- Gentle Slopes attract settlements around Wabiteri.
- Gentle slopes and relatively flat areas favoured transport routes e.g the loose surface roads, bound surface roads from Nabiswera to Kiboga.
- Flat lands favoured construction of water tanks around Kakooge,Iralika, etc.
- Highlands like hills around Wakibombo,Sungira, Lubani, Naimaye etc. attract tourist.
- The saddle between Wakibombo hill and Sungira hill attracted the construction of the Bound surface road.

Note: A learner to score land use is tied to relief and evidence give on a map. **3x3 = 6 scores.**

Total = (20scores)

Item 2.

(a) **A LANDSCAPE SKETCH OF THE AREA SHOWN ON THE PHOTOGRAPH**

KEY

CK= 02 (title, shape and +Mi)

AP= 04 (Physical and man-made features)

N.B

- A sketch must have a title and with proper shape
- Features must be marked and named in their proper relative positions.
- Neatness is a must.

(b) Benefits of commercial farming (evidenced by tea growing shown on photograph).

- It is source of employment evidenced by workers in middle and fore ground; earning them income.
- Basis for industrialisation as evidenced by the factory in the middle ground.
- It is source of government revenue through export of the tea/crop, export duties and other taxes levied on products, workers also pay taxes. Revenue used for development.

- Earns government foreign exchange when goods/crops are exported to other countries.
- Workers acquire skills as evidenced in the middle ground by people picking tea.
- Act as research centres which develop new innovations, varieties of crops, new methods benefit benefit the surrounding areas.
- It provides ready market to manufactured goods like pesticides, fertilizers, buskets used in the farm as evidence in fore and middle ground.
- It helps in fully utilisation of resources which would have remained idle.
- Helps in diversification of the economy since a variety of crops can be exported etc.

4x2 = 8 scores

(c) Advise to the Ministry on the dangers of plantation farming/problems/disadvantages.

- May result to over production which leads to fall in world commodity prices and losses.
- Leads to soil infertility as a result of growing one crop year after year which leads to soil exhaustion.
- May result to decline in food production since people spend more time working on plantations.
- Suffer great losses due to climatic changes/other hazards like; droughts, hail stones, diseases, pests etc.
- Plantations are expensive to maintain both in terms of capital and labour.
- May cause losses as a result of price fluctuations due to competition of crops with alternative synthetic fibres.

3x2 = 6 scores

Total = (20scores)

SECTION B:
Part I

Item 3

(a) Causes of weathering and land degradation/Factors influencing.

- Nature of relief; Gentle and flat relief encourages deep weathering due to water seepage.
- Climatic changes such as heavy rainfall provide water which is an important agent of most of the processes of physical weathering, cold or high temperatures etc...
- Rock structure also causes/influences the rate of weathering e.g. permeable rocks allow water to percolate which causes decomposition of soils, mineralogical composition.
- Man's activities such as;
  - Brick making like in kajansi, clay works
  - Tarmacking of roads
  - Mining and rock quarrying
  - Construction of dams, roads, etc...
  - Cultivation.

Consequences of weathering and land degradation.

- Leads to soil formation.
- Leads to change of landscape such as formation of valleys, gentle slopes etc.
- It may lead to rock weakening making the land subjected to erosion
- Can result to natural hazards such as landslides and rock fall.
- Result to infrastructural damage.

(4x2) causes = 8scores

(4x1) consequences = 4scores

(b) Strategies for sustainable land management.

- Agroforestry; to promote biodiversity, improve on health and increase on ecosystem service.
- Minimizing soil disturbances; maintaining soil cover and using crop rotation to promote soil health and reduce soil erosion.
- Conservation of agricultural practices such as no-till farming, cover cropping, contour plowing.
- Crop diversification.
- Water conservation including rain water harvesting and drip irrigation /implementing efficient irrigation systems to water wastage and surface run off.
- Biodiversity conservation (protecting and restoring natural habitats like forests, wetlands and wild life).

- Using a holistic approach to manage pests and diseases, minimizing the use of chemicals/pesticides and maintaining ecosystem balance.
- Regular monitoring land health and evaluating the effectiveness of practices used to inform decision making and adopt to changing conditions.
- Land use planning to balance competing demands such as agriculture, urbanisation and conservation.

4x2 = 8 scores

Total = (20scores)

Item 4

(a) (i) A river long profile is a graphical representation of a river's elevation or gradient from its source to its mouth.

Characteristics of a river long profile.

- It shows the river's slope and how it changes along its course.
- It has a concave shape with a steeper slope near the source and gentle slope near the mouth.
- Shows changes in the river's gradient which can be influenced by factors like geology, tectonics and erosion.
- It is divided into three river stages such as the youthful, mature and old stage, each with distinct characteristics.

5x1 = 5 scores

(a)(ii) Formation of a waterfall.

A waterfall is a natural flowing body of water that drops vertically from a steep slope or vertical drop in a stream or river.

The Formation can occur in several processes:

- Differential erosion; When a river flows over different types of rocks with varying levels of hardness, the softer rocks are eroded more quickly, creating a drop.
- Through faulting; Tectonic activity can cause faults, which can create a sudden drop in the landscape forming a waterfall.
- Glacial activity; Glaciers can carve out valleys and create steep slopes. leading to formation of waterfalls.
- Erosion activity; water flowing over a rocky surface can erode the rock creating a steep slope or vertical drop.

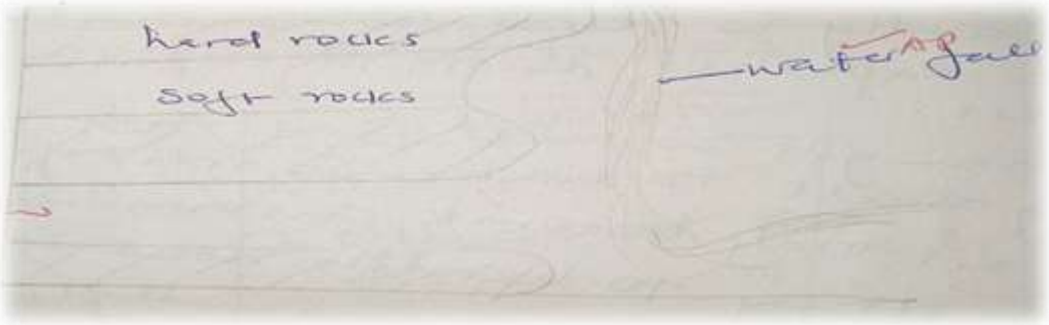

OR

A learner may use stages of waterfall formation.

A small stream or river flows over a gentle slope, the water erodes the rocks, creating a steeper slope and a vertical drop. The waterfall becomes more pronounced as the water continues to erode the rock.

Illustration of a waterfall.

River

A learner may use illustration or not. **5x1=5scores**

(b) Problems faced by people living near and along the river valley.

- They are affected by seasonal floods resulting into damage to homes, crops, and infrastructure.
- Are subjected to water borne diseases like cholera, typhoid and dysentery especially as a result of contaminated water.
- Stagnant water near residential areas can become breeding ground for vectors such as mosquitoes causing malaria and other disease carrying insects.
- Changes in river flow, water quality and access may result to economic decline especially to communities which depend on rivers for their livelihood such as fishing, farming, and transportation.
- Limited access to resources especially to rural communities which lack expertise to manage and maintain rivers.
- Changes in river flow and quality may result to water scarcity.

- Rivers may become contaminated resulting to health risks.
- Transport problems especially its difficult to cross a river.

N.B A learner to score 2 must give CK, and AP. **5x2 =10scores**

Total = (20scores)

Part II

Item 5

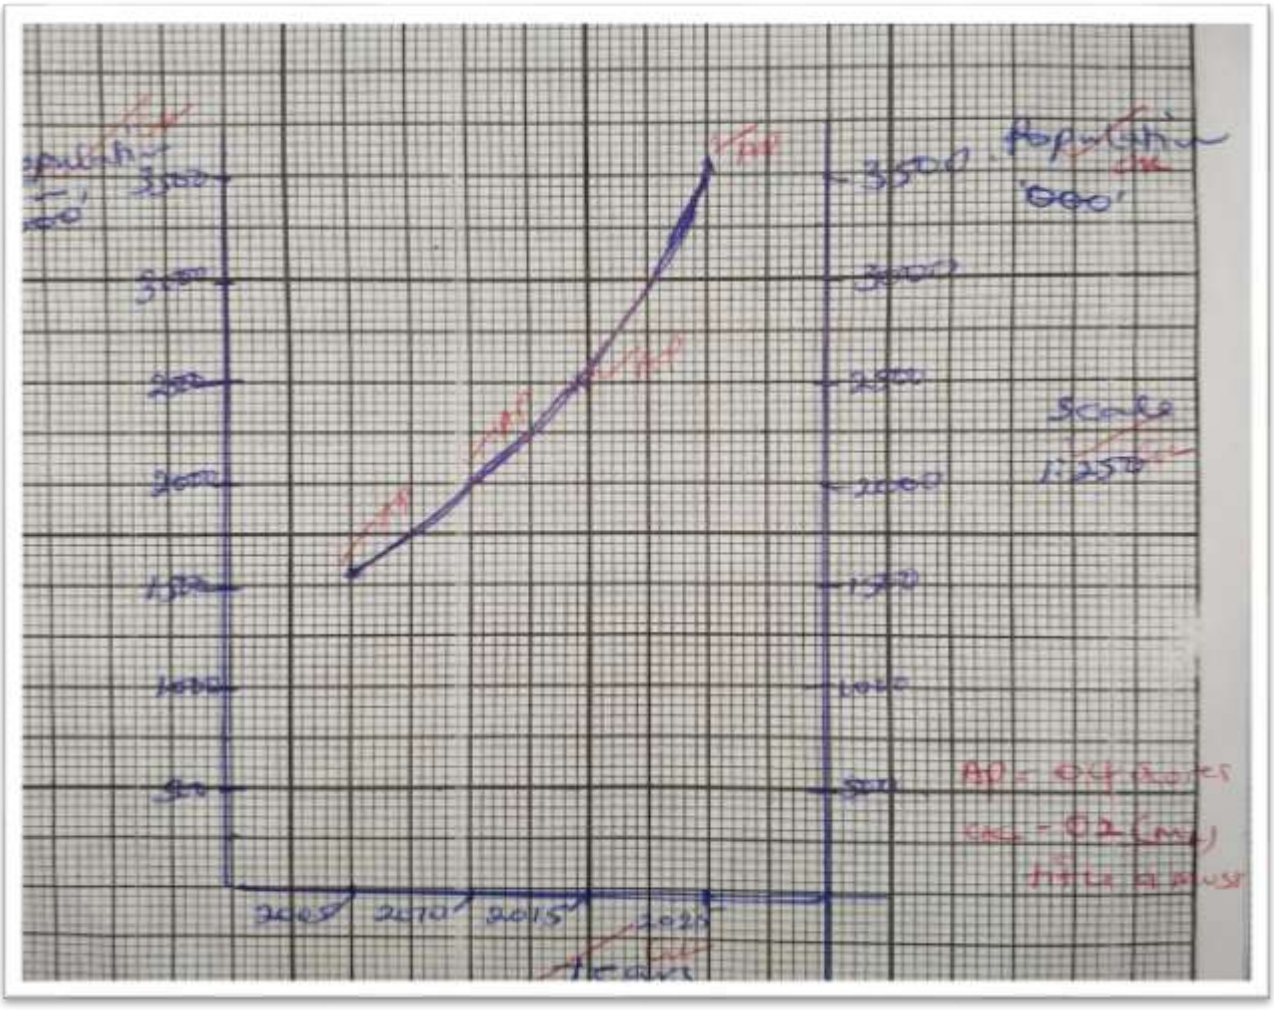

(a) A table showing the trend of population of Kampala metropolitan between 2005 to 2023.

Year	Population
2005	1,576,000
2010	2,016,000
2015	2,577,000
2025	3,846,000

AP = 04 scores

CK = 02 scores

(b) A LINE GRAPH SHOWING THE TREND OF POPULATION OF KAMPALA METROPOLITAN BETWEEN 2005 – 2025

N.B. To score for AP accuracy is a must.

(c) Challenges of Urbanization

- Limited space for expansion of town resulting to encroachment of wetlands, forests, reserves, hence environmental degradation.
- Overcrowding due to population increase in urban centres.
- Traffic congestion as a result of traffic jam due to many vehicles, motor cycles which delays services.
- Population pressure /increase which puts pressure on social amenities.
- Development of slums in urban centres and shortage of accommodation leading to high rent rates.
- Social instability as a result of increased crime rates, violence and social exclusion.
- Increased inequality especially social and economic inequalities where the wealthy aften having better access to services than the poorer.
- Environmental degradation as a result of increased population leads to encroachment of wetlands and forest reserves.
- Increased waste generation resulting in poor waste management lead to pollution and health hazards.
- Air and water pollution from vehicle emissions, industrial activities poor waste disposal etc. leading to health problems.

Advice on how to make Urban life better.

- Government to ensure proper planning and orderly development of towns.
- Rural development through provision of social services like piped water, electricity, education.
- Establishment of income generating activities in rural areas to attract people back to villages and decongest towns.
- Improve on the state of slums by upgrading them and develop in orderly ways and to good health standards.
- Rehabilitation of old infrastructures & such as houses, roads, schools, etc.
- Vertical expansion to save space by designing new buildings to fit modern surroundings.
- Separate people and traffic by building pedestrian walk ways which provide safety to pedestrians and helps establish steady traffic flows.
- Relocate activities to areas outside the city/towns such as small scale industries to reduce congestion and traffic jam.
- Enforce law and order to reduce on crime rates.
- Enforce laws that govern the development of modern cities/urban centres.
- Sensitize and encourage birth control to reduce the rapid population growth.

N.B A learner to score must identify, explain and give example or outcome.(CK, CU, AP).

CK - Identified challenge/advise.

CU - Explanation

AP - Example/outcome

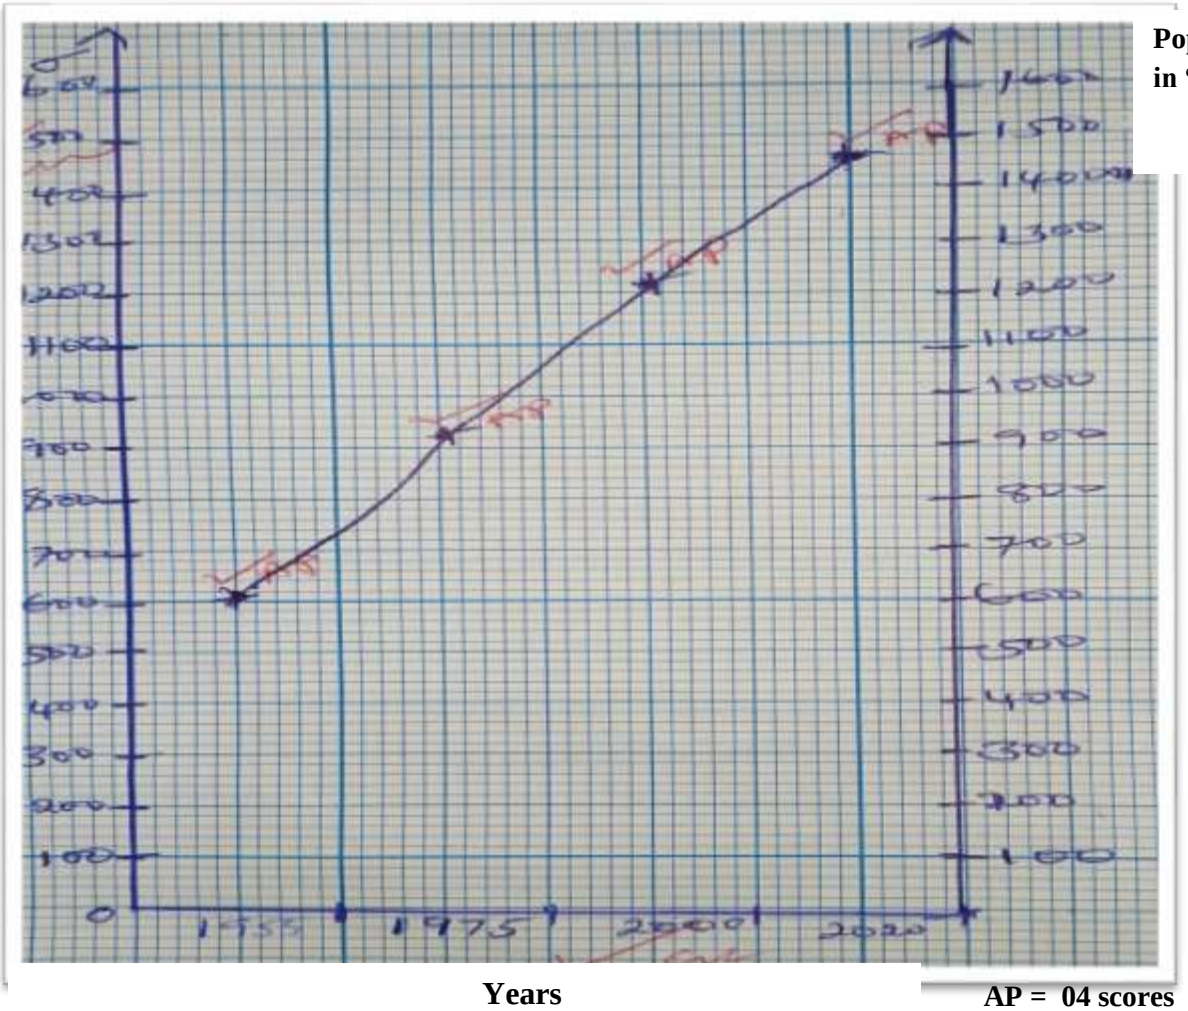

(5x1 scores) challenges

(5x1 scores) advice

Total = (20scores)

Item 6

(a) A LINE GRAPH SHOWING POPULATION GROWTH OF CHINA BETWEEN 1955-2020.

AP = 04 scores
CK = 04 (Mi + accuracy)

A title is a must plus accuracy in plotting

(b) Comment on the population growth rate of China between 1955 to 2020.

The population increased every year. There was a general increase every year, examples:

- From 1955 to 1975 it increased by: 926,240,885 - 612,214,554 = 314,026,331
- From 1975 to 2000 increased by: 1,290,776,380 - 926,240,885 = 364,535,495
- From 2000 - 2020 increased by: 1,437,323,770 - 1,290,776,330 = 146,547,390.

NB A learner is expected to give statement about increase in population and gives examples of any of the above. 04 Scores

(c) Reasons for population growth with reference to China.

- Improved medical services through advances in health care and medical facilities which led to a decrease in mortality rates, and an increase in life expectancy up to 75 years.
- High birth rates lead to rapid population growth especially before a policy of one-child.
- Economic development; China's economic reforms and growth led to improved living standards, reduced poverty and increased population.
- Large workforce which was a driver of economic growth attracting investments and creating opportunities.

For a learner to score 2 should include (CK, CU and AP)

N.B Any additions on a reason are correct so long as a learner convince the examiner with geography knowledge.

2x4 = 8 scores.

Total =(20scores)

END
