S.4 GEOGRAPHY SEMINAR AT VICTORIA HIGH SCHOOL-IGANGA FOR COMPETENCE BASED CURRICULUM HELD ON SUNDAY 28TH June, 2026

GEOGRAPHY SEMINAR MARKING GUIDE, 2026

Item 1 – Sample 1

(a) A SKETCHMAP OF KOC SHOWING PHYSICAL FEATURES

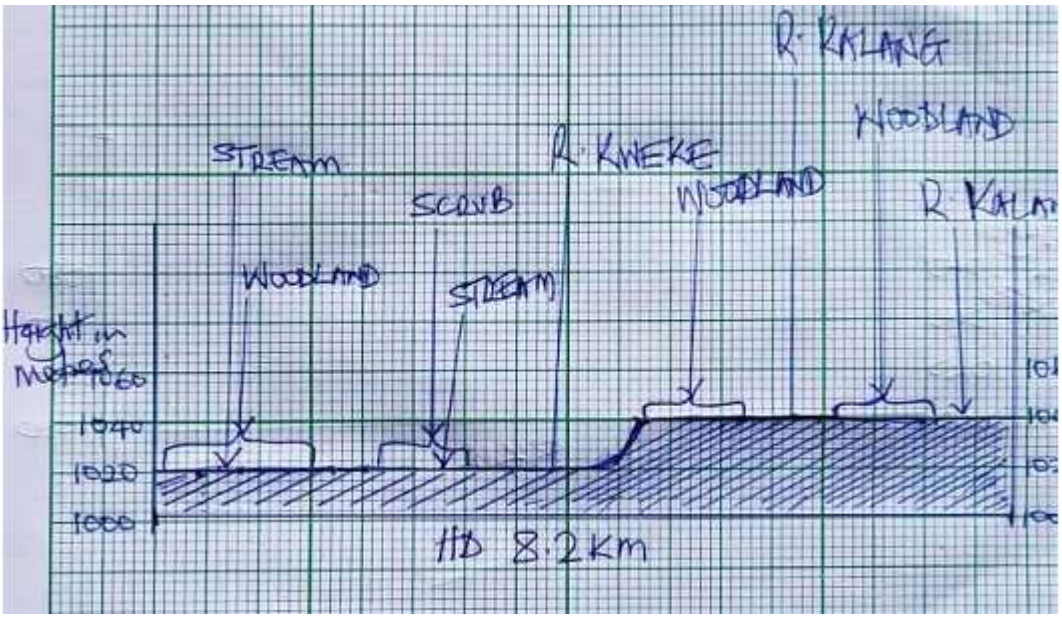

Item 1 (b)

Possible economic activities to be carried out in KOC;

- **Transportation of goods and people** due to railway presence of a loose surface road. Eg from Gulu to Koc, Koc – Pakwach road. This can ease movement at funds hence boosting trade.
- **Hunting** in the woodland, especially wild animals for food and sale of animal skins for income, e.g. at south of Tim Opok and East of Onyona, etc
- **Lumbering** due to a forest North of Larar and a dry weather road in the South of Larar.
- **Forestry** due to the presence of forest South of Lalar, woodland South of Tim Opok, East of Onyona, etc.
- **Irrigation farming**, including crop growing, due to numerous rivers shown in the area. Rivers provide water for irrigation, e.g. River Kulutogo, River Ocaga, River Kalang, etc.
- **Livestock rearing** on subsistence scale due to presence of large areas dominated by thicket at Onyona, Akomo, Larar and scrub at Kalang, East of Barolam, etc
- **Wildlife conservation** due to the presence of a forest at North Lalar, woodland South of Tim Opok, North of Onyona etc.
- **Fish farming**, involving rearing of fish due to the presence of rivers where fish ponds can be established, e.g. along **R. Kulutogo, R. Kalang, R. Lanyoro, R. Ayago**, etc.
- **Manufacturing of forestry products** due to the presence of woodlands south of Tim Opok, North of Onyona, forest North of Lalar.
- **Tourism development** due to the presence of woodlands and forests, e.g North of lalar. These attract tourists who bring foreign exchange.

Item 1 Sample 2

(a)**CROSS SECTION OF KOC BETWEEN EASTING 95 AND 05 ALONG NORTHING 97 SHOWING PHYSICAL FEATURES**

Sample 2

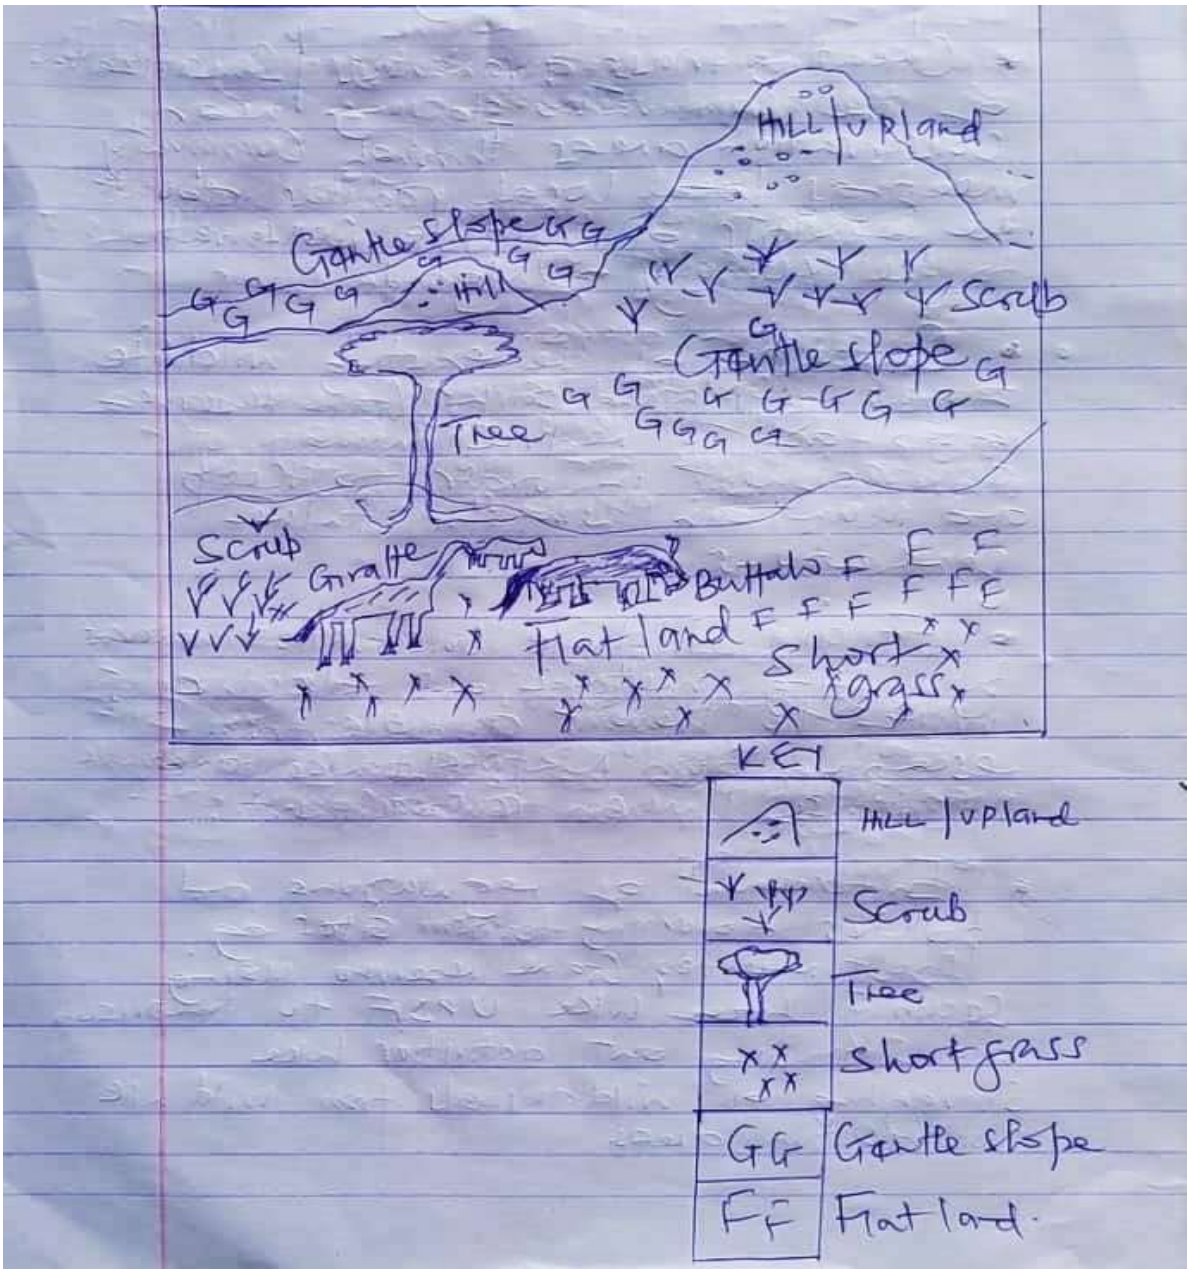

1(b)

- Disastrous floods due to several rivers eg R. Ocaga, R. Kalang, R. Ayago, R. Kulutogo, etc, this can lead to loss of life and destruction of property of the local people.
- Dangerous wild animal may attack people's homes and their crop farms leading to loss of life thus due to presence of woodland eg South of Otim Opok, North of Onyona
- Inaccessibility due to absence communication network eg Roads in North East of the area this leads to poor service delivery leading to poor standards of living
- Pests due to presence woodlands at East of Onyona, forests North of Larar. Pests destroy crops leading to low crop yields and food shortage.
- Natural diseases due to Mosquitoes which breed in forests eg North of Lalar and Woodland South of Tim Opok. These cause malaria to the people which may lead to loss of life and death.
- Drought due to presence of scrub at North of Koc trading centre, South of Onyona, dry conditions discourage crop growing and human settlement since such conditions make life difficult.

- Limited medical facilities like Hospitals, dispensaries due to absence of such in North East of the area East of the area shown.
- Air pollution due to presence of Roads i.e dry weather and loose surface road eg from Gulu to Koc, from Koc Trading centre to Pakwach, Dry weather road from Bobi to Koc Tc making people contract respiratory disease leading to death of people.

Item 2 Sample (1) Response

a) **A landscape sketch of the Photograph / Area shown on the photograph showing physical features and wild animals**

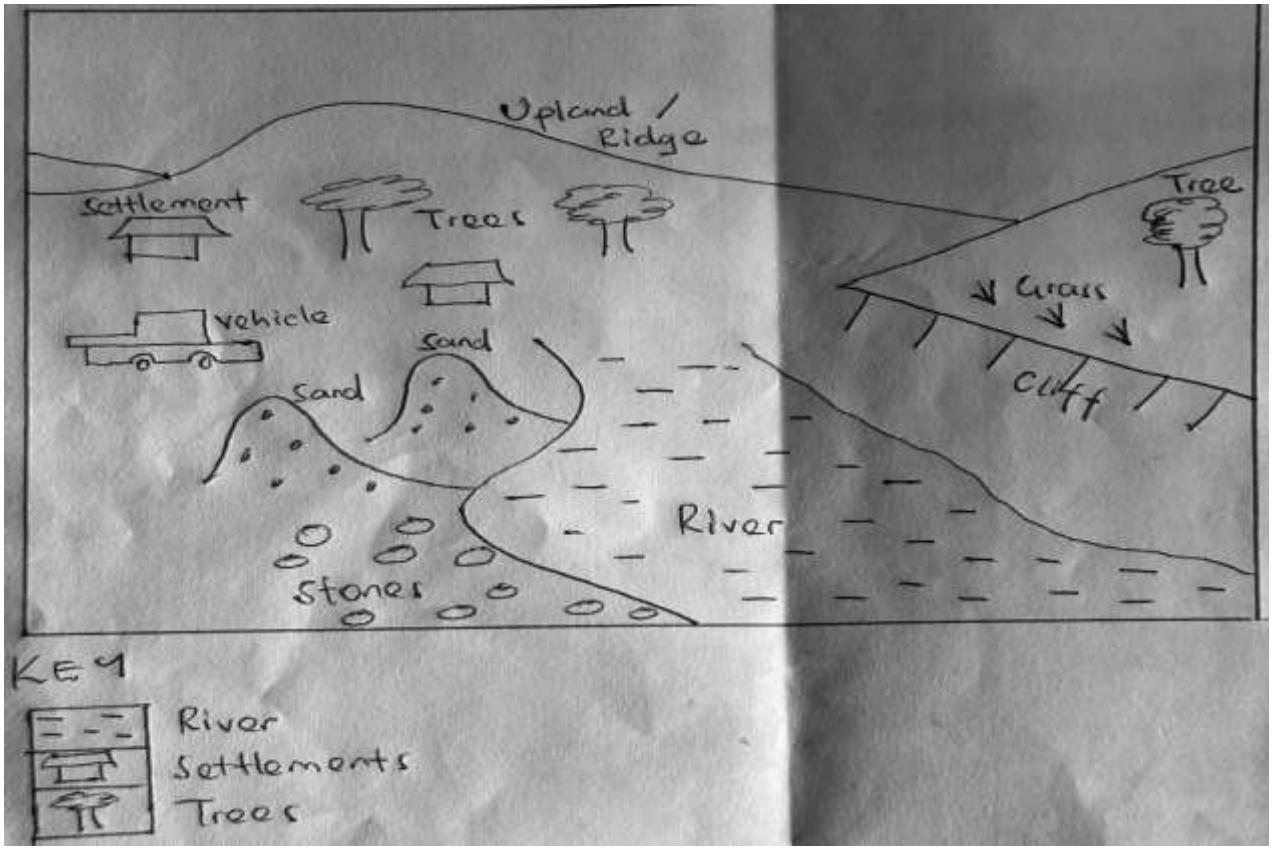

(b) Measures to Boost Wildlife Conservation

- Enacting strict laws against poaching wild animals in game reserves in order to protect them from being hunted.
- Creating mass awareness/sensitization of the communities staying near conservation areas through community meetings local radios about the benefits of wildlife conservation to the economy of Uganda.
- Gazetting of the existing wildlife zones e.g National parks, game reserves so as to reduce human encroachment in order to keep and maintain them for future generations.
- Fencing wildlife conservation areas by using metallic and electricity wires to prevent animals from escaping from National parks and minimize human encroachment.
- Enforcement of regulations and policies governing tourism sites, e.g., forest reserves, game reserves, using security forces like the UPDF to imprison and stamping out activities like smuggling of wild animals from wildlife conservation areas.
- Constant aerial spray of game reserves infested with wide spread diseases and pests in order to eradicate such diseases so as to maintain better health of wild animals.
- Planting more trees in game reserves and forest reserves to maintain vegetation cover that is destroyed by wild flies and overgrazed areas.
- Strict laws against wild bush fires, usually started by nomadic pastoralists, to maintain vegetation cover in conservation areas.
- Recruiting and training more game rangers and wardens to carry out constant patrols and monitoring the movement of animals.
- More funding for wildlife conservation projects and activities by the government and international agencies, like DMF e.g telecentres at at Bwindi Impenetrable Forest, for continuous conservation of wildlife.

Item2 Sample 2

a) **A landscape sketch of the Photograph / Area shown on the photograph showing physical features and man-made features**

b) Measures for effective mining and sustainable land use planning

- Proper licensing of mining operations before mining to check on effects on water, soil and people.
- Sensitization of people on proper ways of sustainable mining and other land use practices to maintain natural beauty.
- Land use zoning to regulate mining activities in wetlands, forests and near settlements.
- Use of proper mining methods like underground mining in order to protect physical landscape and vegetation.
- Carrying out community consultation about land, water points, graves for compensation to reduce post mining conflicts.
- Encouraging mining in phases like digging small areas to leave the rest of the land for farming and other land uses.
- Creation of alternative employable opportunities like hand craft making to reduce mineral exploration.
- Building drainage lines along water resources to prevent dirty mine water away on rivers for safe water management for human consumption.

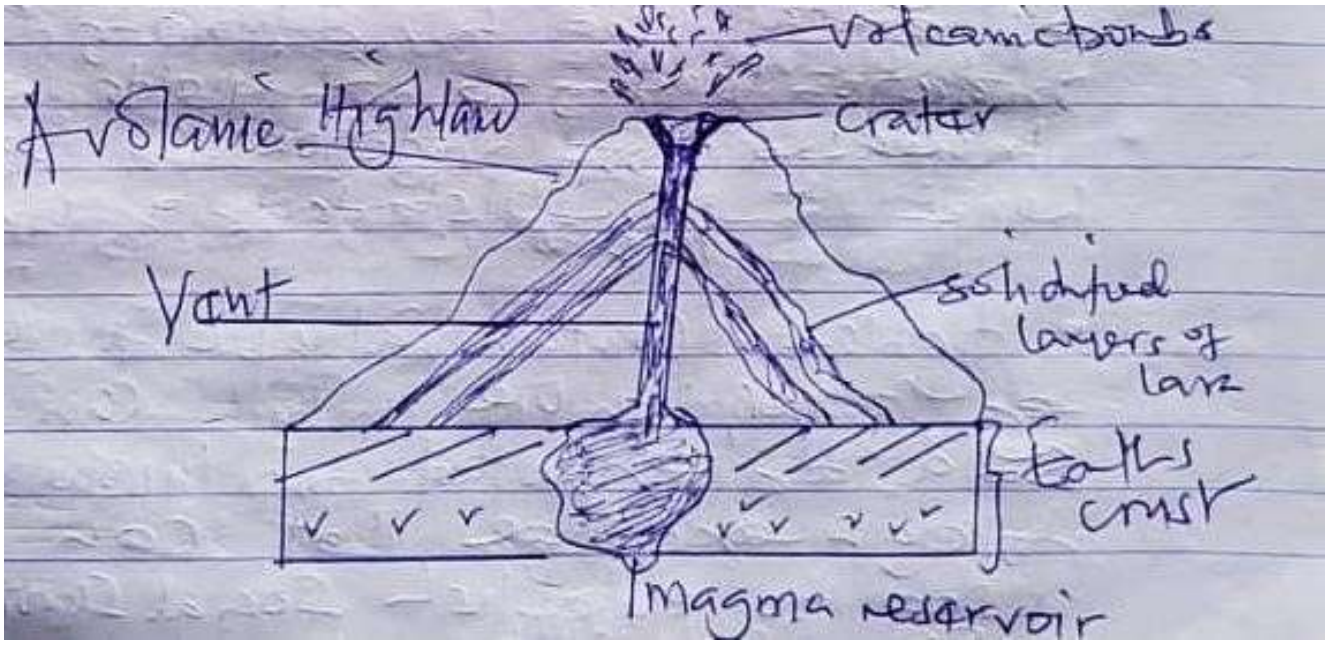

Item 3 Response

(a) Mt. Muhavura / Mt. Mufumbiro

Process Explained;

- They were formed by volcanicity.
- Volcanicity refers to the ejection of magma, gas, and liquid materials from the Earth's crust onto the Earth's surface.
- Magma is formed by intense heat and pressure within the Earth's crust.
- Heat is generated by geo-chemical reactions and radio activity, which melt rocks.
- The molten rock is forced from the crust through vents or pipes.
- When magma reaches the surface, it cools and solidifies around the vent. It builds a cone-shaped feature after solidification to form a volcano or volcanic highland.

Illustration of a Volcanic Highland

(b) Effects of highlands on Human activities:

- Highlands contain fertile soils e.g volcanic soils used for crop cultivation. Crops are sold for income and provision of food to the local community.
- Highlands have dense forests due to heavy rainfall and fertile soils. Forests support lumbering, timber is sold for income and making of various products like furniture.
- Highlands are catchment areas for rivers. These rivers provide water for irrigation hence boosting crop cultivation.
- Tourist attraction due to a beautiful scenery created by different features e.g craters, rivers. Tourist bring foreign exchange for infrastructural development e.g roads which ease movement of people and services.
- Highland areas help in formation of rainfall used for supporting crop production leading to high yields and increased food production for people hence improving standards of living.
- Highlands contain valuable minerals e.g Copper, Iron ore which can be sold and exported for income and foreign exchange that can be used to establish social services e.g schools, hospitals etc.
- Highlands encourage human settlement on gentle slopes due to cool weather climate ideal for man's settlement
- Highlands contain rocks and precious stones used for construction of roads/houses leading to development estates which generate income
- Highlands encourage soil erosion, common on steep slopes. Severe soil erosion leads to destruction of property like crop farms, houses leading to food shortage.
- Highland area experience landslides due to steepness of the landscape and heavy rainfall which results into property loss and life.
- Infertile soils in some parts of the highland discourage crop growing leading to low yields hence food shortage and famine
- Dry conditions occur on the lee-ward side of the highlands limiting crop cultivation hence food shortage
- Inaccessibility due steep gradient making road construction difficult. This limits movement of goods and people leading to limited trade hence economic retardation

Item 4 – Response

(a) Identification of stages of a River & its:

- **YOUTHFUL STAGE | Turbulent Stage**
    - Vertical erosion of the river channel
    - Headward erosion
    - Fast water flow
    - High river energy
    - River flow over a steep gradient
    - V-shaped river channel
- **MATURE STAGE | Middle stage**
    - Lateral erosion
    - Reduced speed of river flow
    - Reduced gradient
    - Initial river deposition
    - U-shaped river channel
- **OLD STAGE | SENILE STAGE | FLOOD PLAIN**
    - Lower gradient / gentle
    - Low velocity / speed
    - Sluggish river flow
    - Extreme deposition at the river bed
    - High volume of water

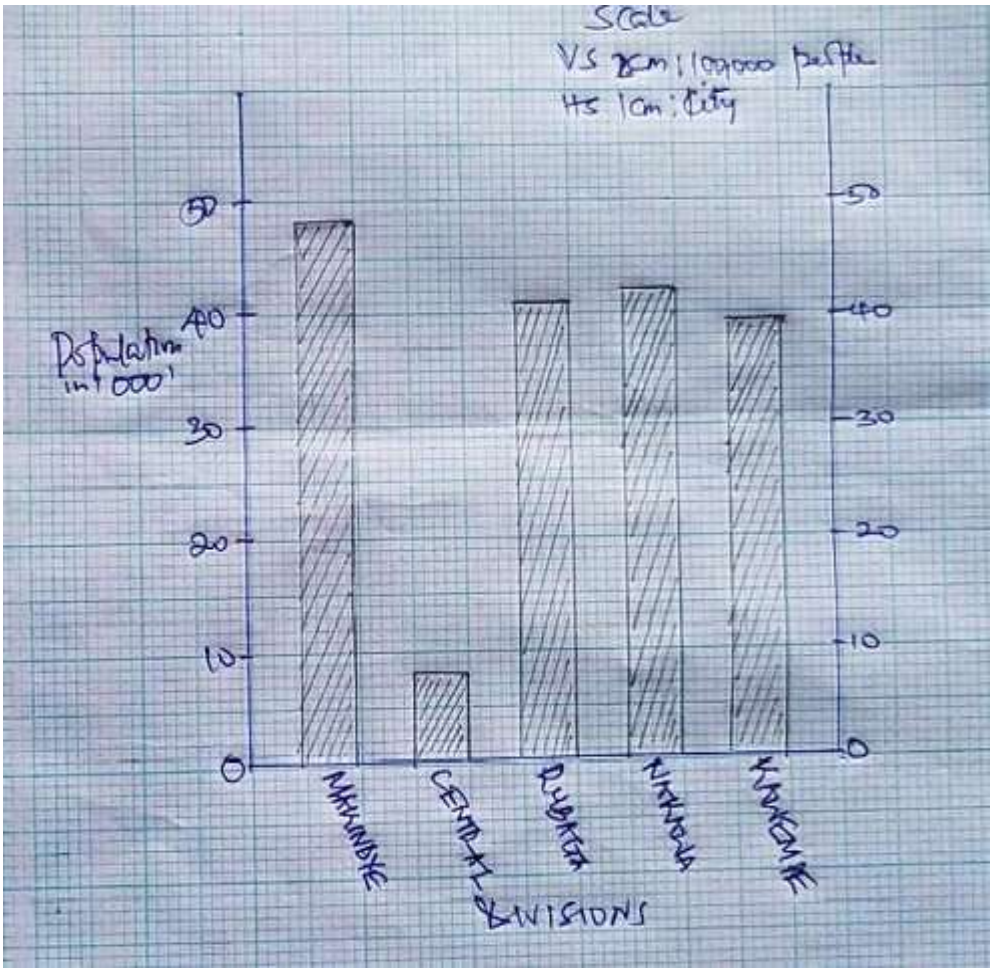

(b) Economic activities in River basins

- Fishing: due to presence of abundant fish species. Fish can be caught for food to sustain lives and for sale for income to improve standards of living e.g from ox-bow lakes
- Sand Mining on river banks for construction of houses and infrastructures e.g roads thus easing transport of people and goods.
- Tourism development. Rivers are tourist attraction hence provision of foreign exchange from tourists due to features e.g waterfalls, ox-bow lakes, deltas etc. abundant
- Irrigation farming. The presence of water can be used for irrigation of crops for food and income from sale thus improving standards of living
- Recreation: Rivers can support games such as swimming, rafting, photography due scenic beauty thus earning income which improves standards of living.

- Water transport: along rivers this helps in transportation of goods and services and passengers thereby boosting trade. Transport is possible on ox-bow lakes.
- Art and Craft: Rivers have papyrus swamps along their banks which support making of baskets, mats, local carpets for home use and for sale to generate income
- Wildlife conservation: River basins are habitats for a variety of wild animal species and plants e.g snakes, crocodiles this helps to maintain the ecosystem and provide a potential for tourism development and environmental protection for future generation.
- H.E.P generation and power plants can be established on water falls to generate power for industries which create/provide jobs for income.

Response 5(c)

A BAR GRAPH SHOWING RESIDENT POPULATION FOR DIVISIONS OF KAMPALA IN 2024

OR

Response 5(a) Total population:

486,762 + 81,658 + 410,400 + 428,732 + 390,170 = 1,797,722 people

Makindye = $\frac{486,762}{1,797,722} \times 360° = 97.4°$

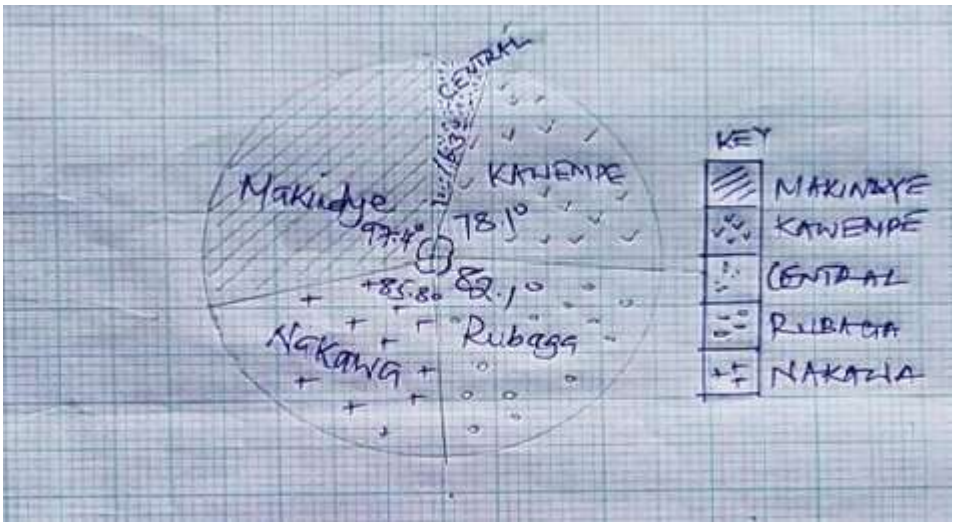

Central = $\frac{81,658}{1,797,722} \times 360° = 16.3°$

Rubaga = $\frac{410,400}{1,797,722} \times 360° = 82.1°$

Nakawa = $\frac{428,732}{1,797,722} \times 360° = 85.8° \approx 86°$

Kawempe = $\frac{390,170}{1,797,722} \times 360° = 78.1°$

Response 5(a) A PIE-CHART SHOWING RESIDENT POPULATION FOR DIVISIONS OF KAMPALA 2024

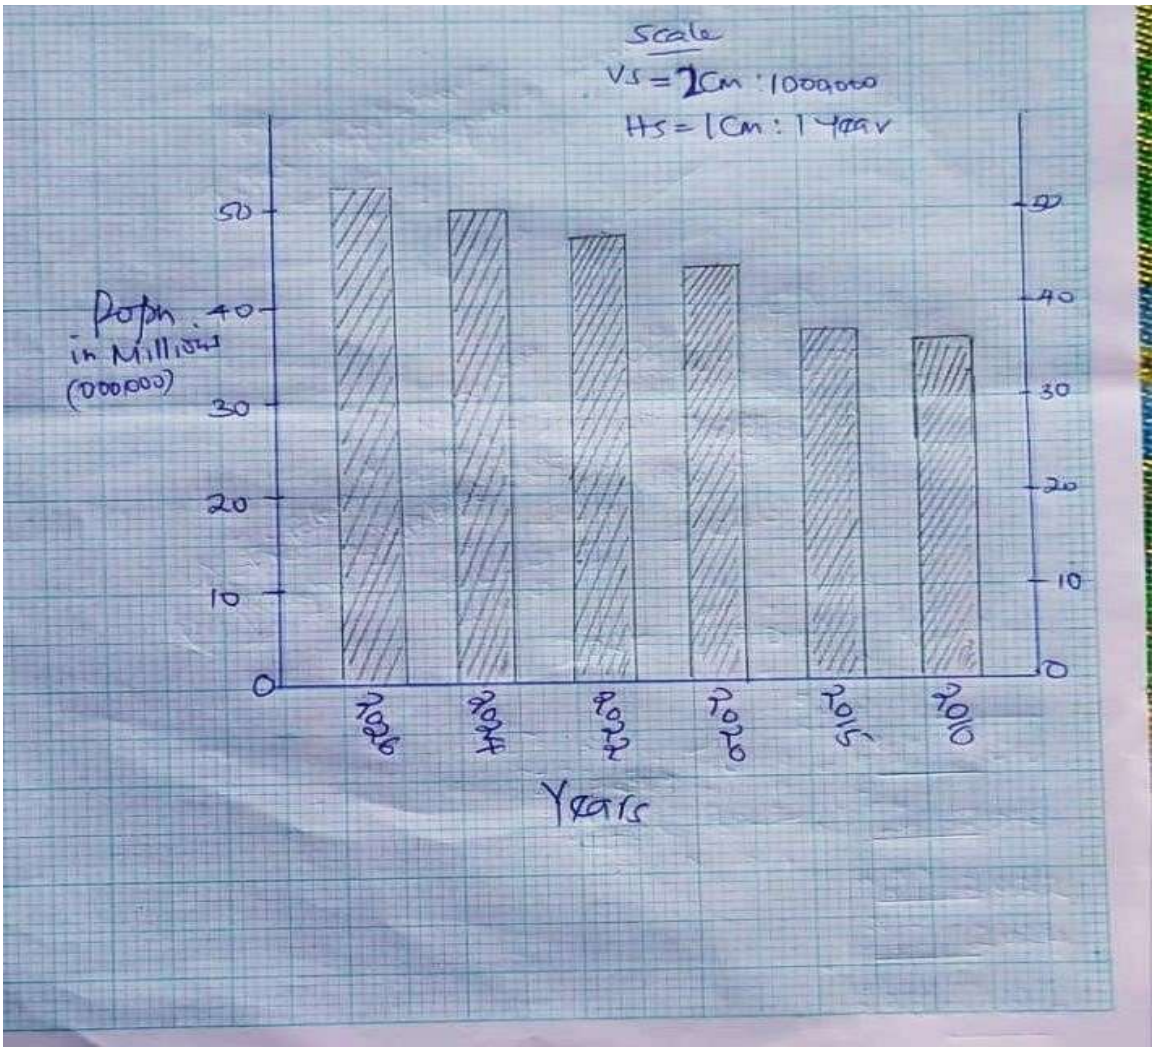

Item 5 Response (b) Measures to Improve lives of people living in urban areas

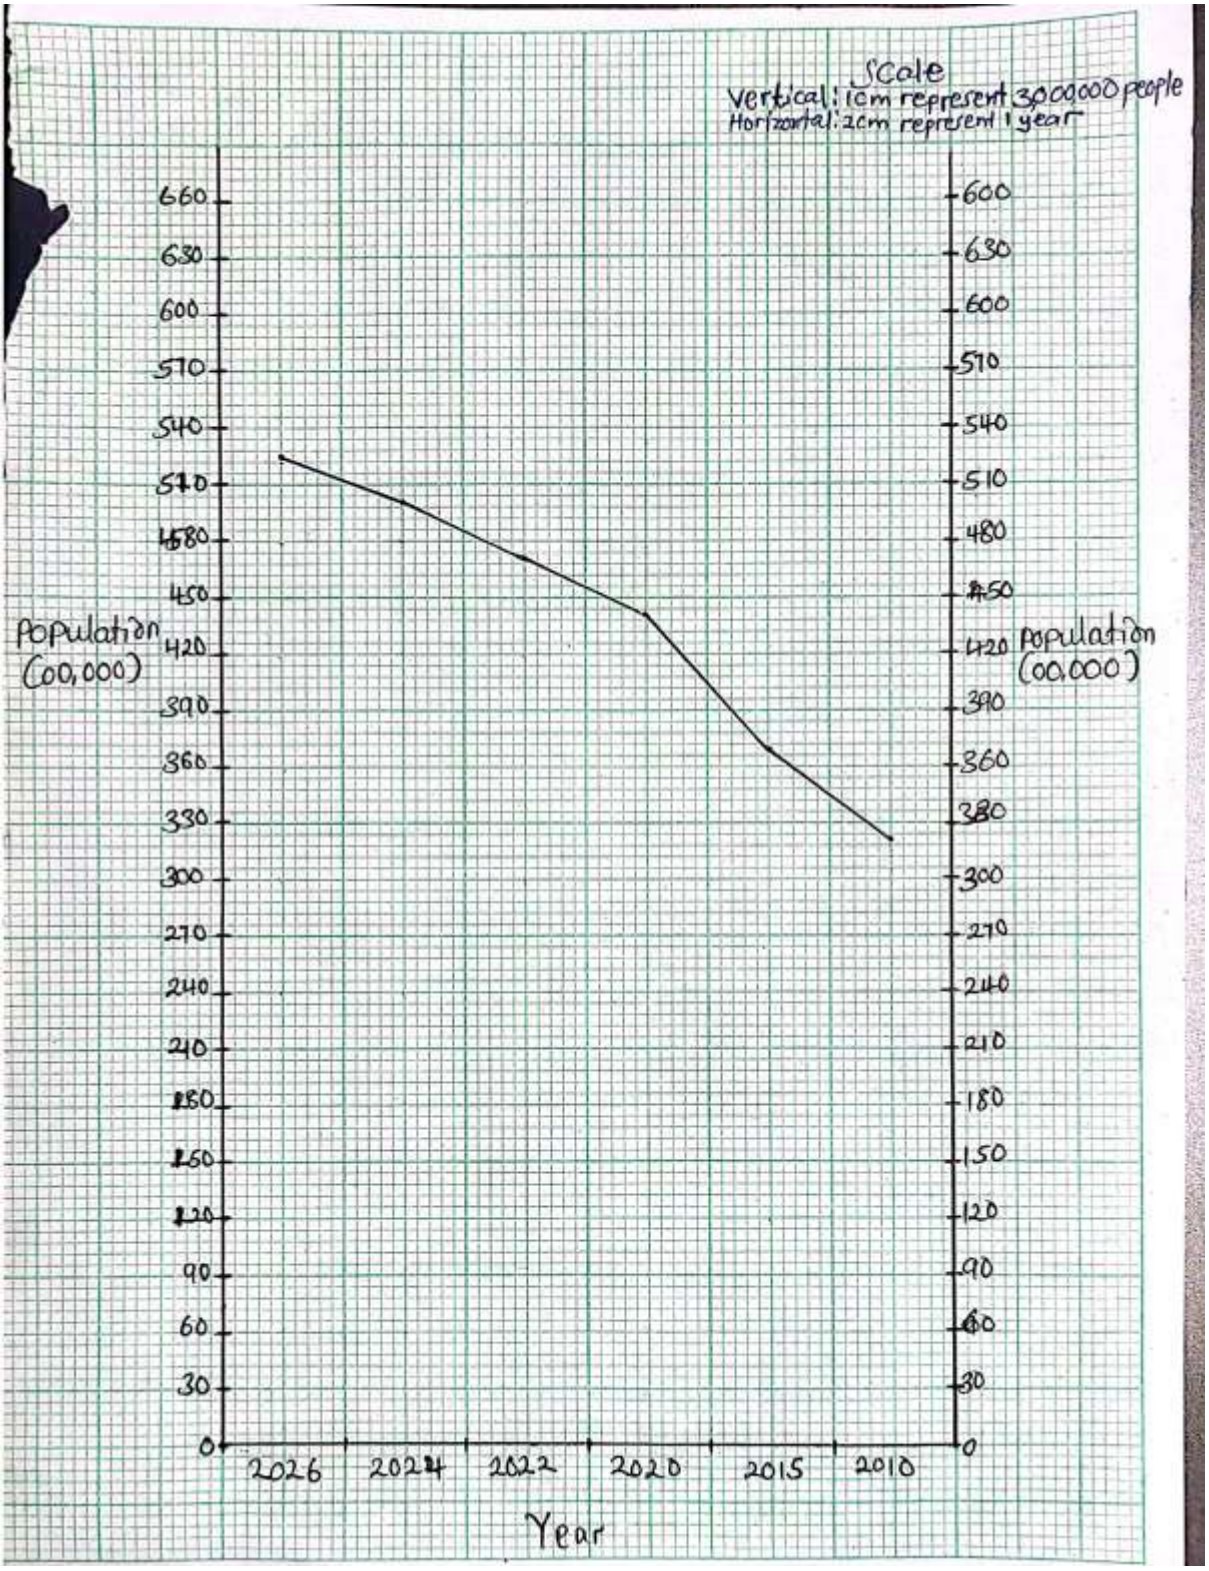

- Construction of small-scale industries to create jobs to employ more youth so as to improve incomes hence raising standards of living.
- Improving medical facilities by establishment of new and renovating the existing ones e.g hospitals to cater for urban people leading to better health.
- Promotion of skill development among the youth e.g vocational skills to enable people to be able to create their own jobs for more income thus improving standards of living.
- Expansion of social services like schools to enable children of the urban poor access education.
- Sensitization of the masses about the negative impacts of urbanization through mass media, community meetings, poor waste disposal, to create awareness about such vices.
- Encouraging Vertical expansion which involves construction of storeyed buildings to reduce the challenges of land shortage and utilize the available space effectively.
- Development of Small and medium sized enterprises in urban areas in order to create jobs for more income that will improve people's standards of living.
- Planting of trees in order to create green belts in the city in specific zones so as to reduce the impacts of environmental degradation and climate change.
- Enacting laws to guide urban development so as to have a well-planned city.
- Encouraging the use of public transport e.g Buses, trains so as to ease movement of people in the city and to curb traffic congestion.
- Construction of low cost and affordable houses for the low-income earners in order to have better accommodation.
- Provision of start up capital with lower interest rates e.g PDM, Emyooga to enable people start their own small business projects to earn income for improved standards of living.

Response Item 6(a) Either

A BAR GRAPH SHOWING UGANDA'S POPULATION FROM SELECTED YEARS BETWEEN 2010 TO 2026.

A LINE GRAPH SHOWING UGANDA'S POPULATION FROM SELECTED YEARS BETWEEN 2010 TO 2026.

OR Total population =

= 52,700,000 + 50,000,000 + 47,000,000 + 44,000,000

37,000,000 + 36,000,000

= 222,700,000

2026 = $\frac{52,700,000}{222,700,000} \times 360^\circ = 85.1^\circ$

2024 = $\frac{50,000,000}{222,700,000} \times 360^\circ = 81^\circ$

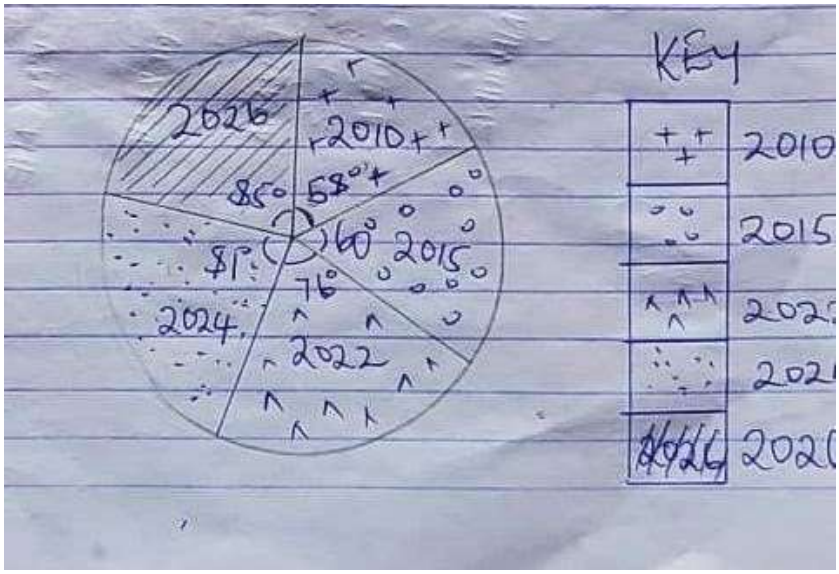

2022 =

$$\frac{37,000,000}{222,700,000} \times 360^\circ = 60^\circ$$

2015 = $\frac{47,000,000}{222,700,000} \times 360^\circ = 76^\circ$

2010 = $\frac{36,000,000}{222,700,000} \times 360^\circ = 58^\circ$

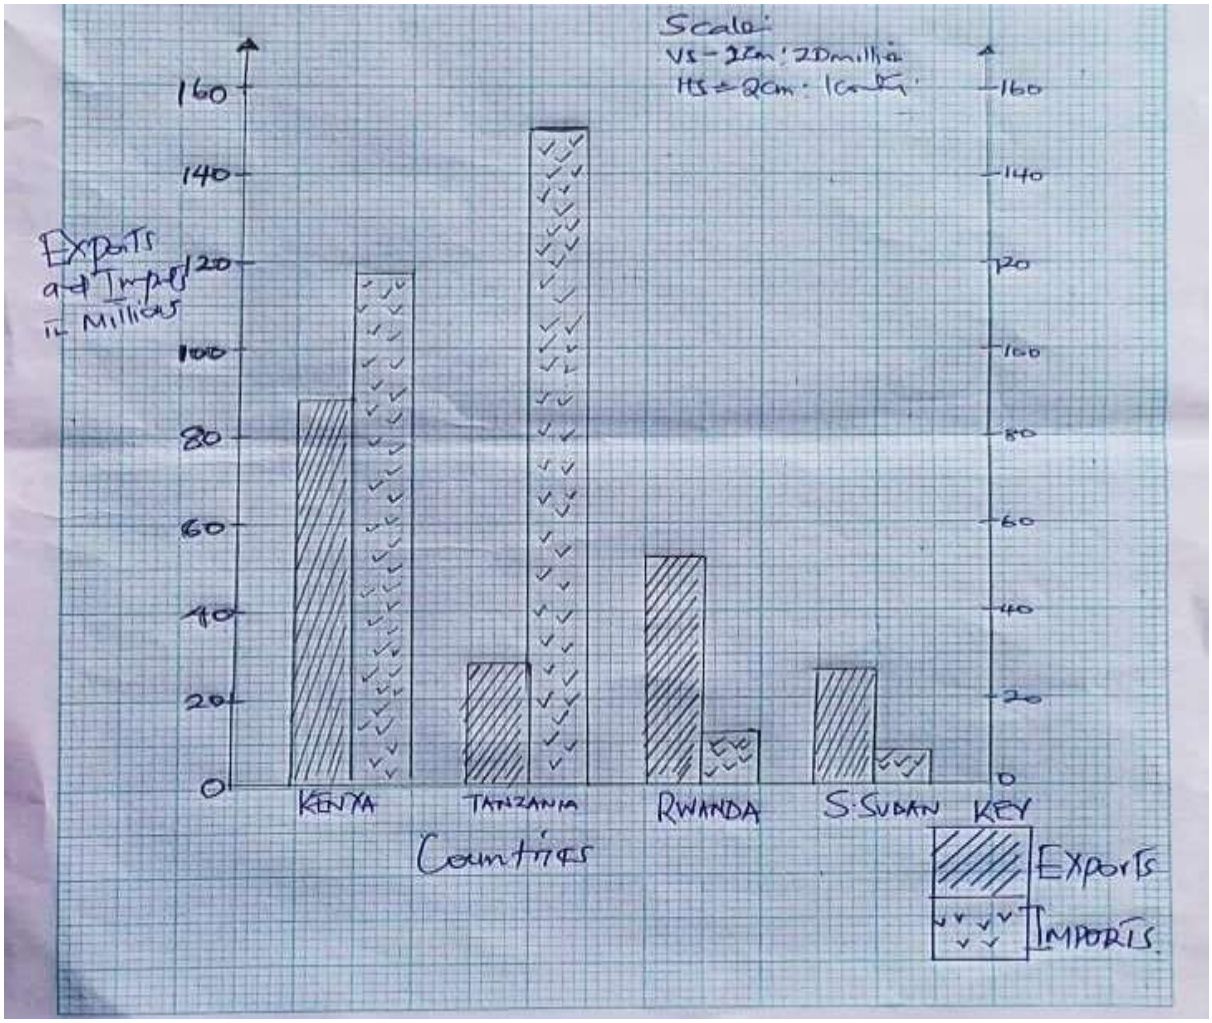

A Pie-Chart showing Uganda's population from selected Years Between 2010 – 2026

Response (Sample 1) 6(b) Item 6 (Sample 1)
Challenges Uganda is facing from an increased population and measures to overcome them.

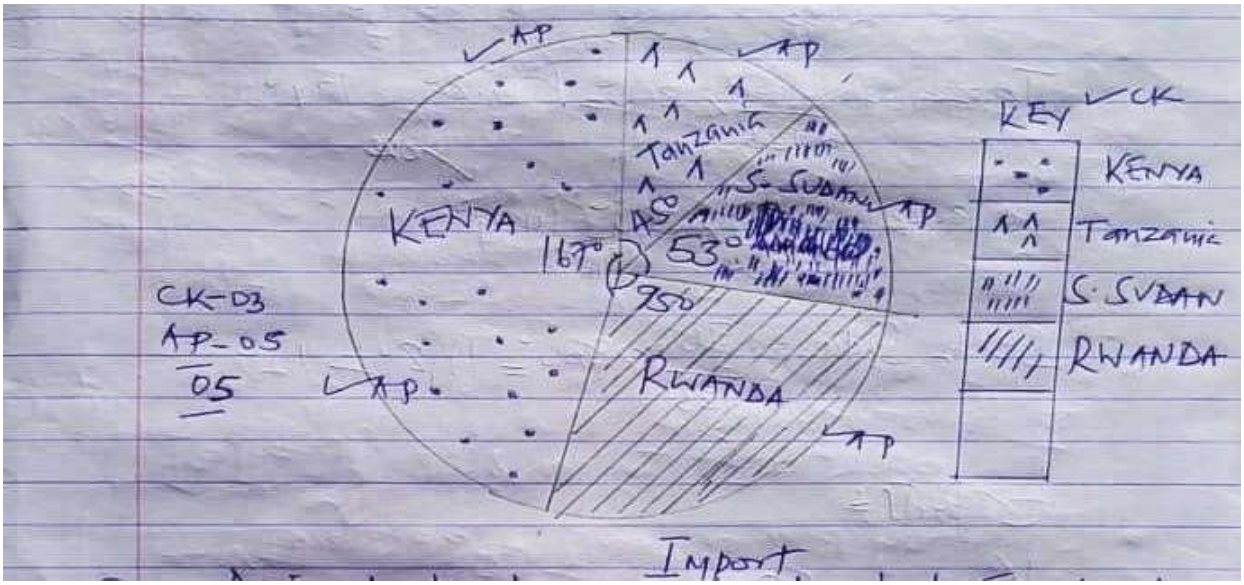

- Unemployment, available jobs are fewer compared to high number of people leading to lower incomes and poor standards of living; Establishment of Industries to employ the excess population.
- Easy spread of diseases due to overcrowding e.g cholera leading to loss of life. Investing more in medical services to improve health.
- High crime rate e.g robbery, murder due to unemployment. Deployment of police in high risky areas to curb crime.
- Slum development with poor housing facilities leading to poor health and standards of living; Construction of low-cost houses affordable for the lowincome earners.
- High rates of school drop out especially the girl-child due to lack of fees and school requirements brought by poverty. Promote Skills development such as Vocational skills for the youth to equip them with employable skills that can enable them to be job creators.
- Poor sanitation due to poor disposal of wastes leading to easy spread of diseases. Establishing disposal outlets in overcrowded areas.
- Deforestation which involves cutting forests in order to create land for settlement and crop farming; encourage planting of trees to recover the forests i.e Afforestation, Re-afforestation.
- Clearing of wetlands ie wetland degradation for human activities e.g settlement, farming leading to climate change; restoration programmes by NEMA, passing strict laws for those involved in wetland encroachment.
- Traffic congestion in overcrowded areas causing delays and accidents; encourage the use of traffic police, traffic lights to control the flow of movement of vehicles.
- Encroachment on wildlife conservation areas such as Game reserves, forest reserves like Mabira Forest and L. Mburo National Park for people's settlement which leads to disappearance of wildlife; Gazetting the wildlife zones to restrict human settlement and other activities.
- Sensitization of the masses about the dangers of a large population and the advantages of having small families.

Sample 2 Item 6(c) A COMPARATIVE BAR GRAPH SHOWING TRADE BETWEEN UGANDA AND HER PARTNERS 2023

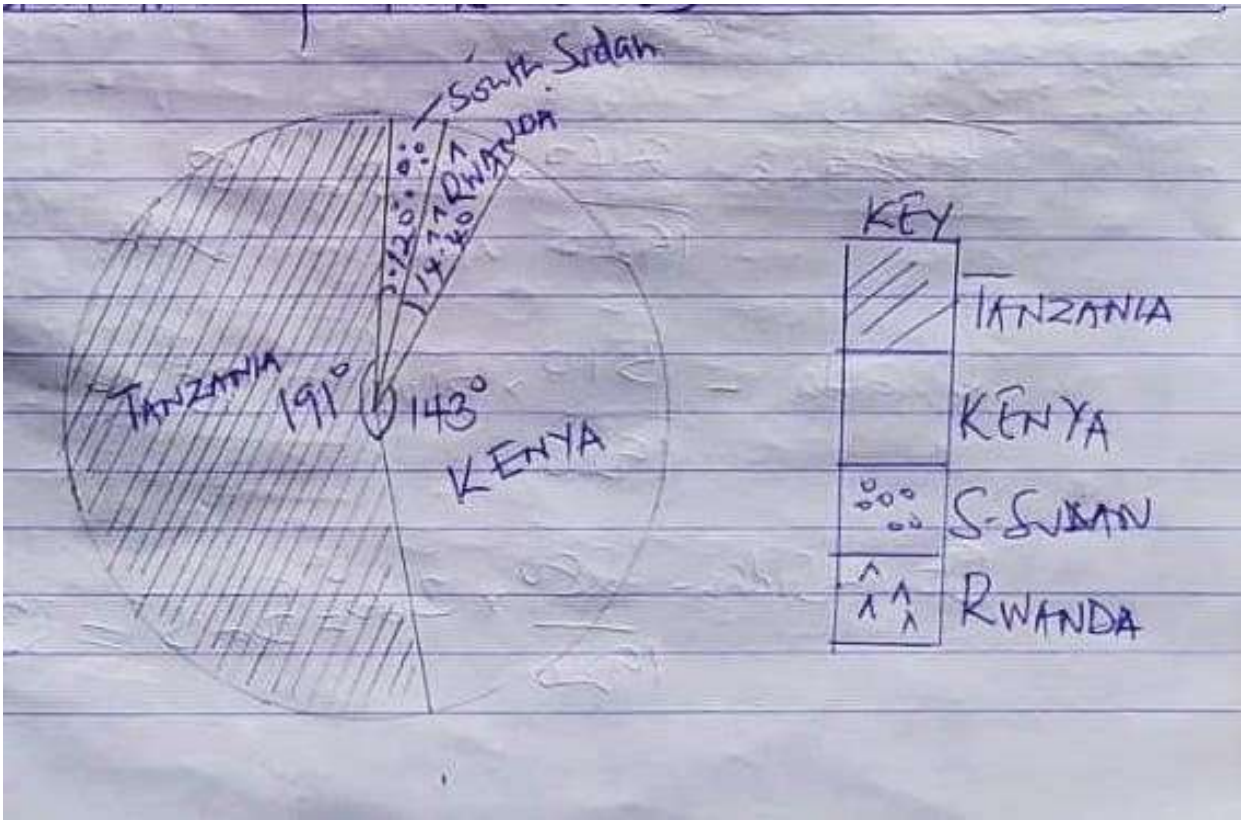

COMPERATIVE PIE-CHARTS TRADE BETWEEN UGANDA AND HER PARTNERS 2023 (EXPORTS AND IMPORTS)

1. A Pie chart showing Exports between Uganda and her partners 2023

2. A pie-chart showing Import trade between Uganda and her partners 2023

Sample 2 Item 6 (B)

(B) Response: Measures Uganda Can adopt to promote trade with her neighbours:

- Improving the transport system through construction and renovation of roads and railways to ease the movement of goods to the markets.
- Establishment of Industries to process raw material and finished goods to add value so as to attract more buyers.
- Maintaining standard of goods by Harmonizing Uganda Bureau of Standards and Kenya Bureau of Standards to maintain quality of goods produced.
- Introduction of new products on the market needed in other countries to increase the volume of products and reduction of competition with other countries e.g Uganda can make processed edible cooking oil to supply to DRC, Rwanda.
- Carrying out market research to find out items needed by different countries to widen market for the goods.
- Improving security by deployment of security personnels and forces e.g UPDF at the border in order to provide a safe environment for investment and trade.
- Carrying out advertisement of the goods available eg radios, tv, social media to increase awareness of the products on the market for potential buyers.
- Encouraging learning and use of a common language e.g Kiswahili to ease communication between traders hence easy transactions.
- Encouraging continuous production of goods through establishment of power generation facilities to provide an adequate power supply for processing of goods to be sold.
- Encouraging the use of common currency to reduce unnecessary delays during currency exchange at the border to ease trade transaction and increase profits for the traders.
