INSTRUCTIONS TO CANDIDATES:

This examination paper consists of two sections; **A** *and* **B**. *It has* **four** *items.*

Section **A** *has* **two compulsory** *items.*

Section **B** *has* **two** *optional items; Respond to* **one** *item.*

Respond to **three** *items* **in all**.

You may use diagrams where applicable to illustrate your responses.

Any additional item(s) responded to will **not** *be scored.*

Responses to each item **must** *start on a new page.*

@2026 UTEC Mock Examination

CamScanner

SECTION A

All *items in this section are* **compulsory.**

Item 1

The natural environment is composed up of mineral resources, water resources, human resources, atmosphere, land, animal and the vegetation resource. Man has made use of them to satisfy his needs. However, as our human numbers increase, these resources are being exploited causing either extinction on declines. Water volumes in rivers have dropped, wells dried up, pasture and crops withering.

A local study tour on your village observed deterioration in vegetation cover where forests have deteriorated to woodlands, then grasslands, dry bush and scrub and eventually bare grounds. This is also observed in the table below showing area under forest and for selected countries of the world over years.

Country	2010 area 000HG	2020 AREA IN 000HG
Brazil	171814	131724
DRC	900133	655121
Sudan	54421	65217
Canada	15257	17278

Task:

(a) Draw a suitable statistical diagram to show the information in the table and comment on trend.

(b) Make a write up report you would present in a local council meeting on why this trend is typical of a developing country and suggest possible measures to mitigate this challenge as observed in the scenario.

Item 2

The number of Ugandans aged 15 years and above engaged in subsistence farming is steadily declining as more people shift to salaried employment and the services sector according to findings released By Uganda Bureau of Statistics (UBOS). The report indicates that the population of households producing for their own consumption dropped by 4.6% over the last 3 years, signalling changing economies and employment patterns across the country.

CamScanner

The findings are contained in the Uganda Harmonized Integrated survey report covering the 2021/2022, 2023/2024 and 2024/2025 survey waves. However, non-farm wage employment increased from 14.9% in 2021/2022 to 19.7% in 2024/2025. Overall, we are observing a gradual shift in the employment structure with a decline in subsistence work.

As a geographer having read the report, you have been invited to a radio talk show "Issues at hand" to analyse the situation.

Task:
Write a report on why this trend is typical (true) of a developing country and suggest possible remedies to overcome this situation in the scenario.

SECTION B

Respond to only **one** *item from this section.*

Item 3

Every year the Saharan swallows up acres of farm land as it marches inimitably towards the south and west. As human settlements get drier and drier, pastoralists depend on tiny patches of grasslands give up their herds and migrate to the cities. Agriculturists abandon their villages to hunt for water or food growing of food for local consumption for example, receives low priority from many governments' causing food shortage.

This trend is typical of many rural settings of Uganda leading to food shortage and supplies.
Donors such as WORLD BANK and the USAID have been pouring in millions of dollars for development over the last decade. The rhetoric is of improving food production for local consumption but the reality has proven different.

The entire food distribution and storage system in many countries cause a gap not in food production but in the number of people who have access to food. *Source: People and environments, issues and inquiries pg 84*

A local study tour on your village depicted a similar situation and this has raised serious environment concern. You have been invited for a meeting to address the situation on food security and food culture.

CamScanner

Task:
Write a report you would present to local council meeting on the trend and suggest steps you would apply to mitigate it as observed from the scenario.

Item 4
The fuel crisis has been a long-standing situation in both developed and developing countries. The increasing use of Fossil fuels like coal, natural gas and oils have had diverstating effects of the natural environment upsetting the ecological balance of nature. The same applies to renewable energy resources. this has been the Sahel region of Africa. In Uganda for instance, has led to loss of vegetation cover causing severe soil erosion. Ugandans have resorted to use of cow dung and human wastes to meet energy needs. This has deprived the soils of its nutrients and further reduced its productivity.

Your geography class conducted a field work excursion in your locality and observed severe acute water shortages, declining crop yields and severe soil erosion, gullies created. You have been invited by a local radio station or NTV television station on a programme "issues at hand".

Task:
Write a presentation you would present on the benefits Ugandans would set through sustainable use of renewable energy and how the challenges should be mitigated to solve them in the scenario above.

© 2026 UTEC Mock Examinations

CamScanner

SECTION A

All *items in this section are* compulsory.

Item 1

For this item, use the East Africa 1:50,000 (UGANDA) map extract of Moroto series Y732, sheet 27/3 Edition 5 – D.O.S.

Moroto District is one of the districts in North-Eastern Uganda located between latitudes 2°30' and 2°40' and longitudes 34°35' East of the Greenwich Meridian.

The region has a magnificent physical landscape characterized by mountains, rock outcrops, many cliffs, different vegetation types, and rivers radiating from the mountainous areas, while some rivers meander in the low-lying areas. However, despite this beautiful scenery, most of the local people living in the area are still very poor and lack knowledge on how they can use the environment to improve their way of life.

The Local Council Administration of Moroto has organized a sensitization meeting in Moroto Town with various key stakeholders in the region, and you have been invited as the chairperson of the Geography Club to represent your school. The main agenda of the meeting is to propose various investment potentials for the local people living in the area, based on the physical landscape, and also to suggest sustainable solutions to address the slope-related hazards limiting development in the region.

Task:

Prepare a presentation you will use during the meeting. The presentation should include a suitable illustration showing the landscape of the area and the strategies to address the main agenda of the meeting, citing practical evidence from the map.

Item 2

Uganda's drainage system is composed of rivers flowing from highlands into lakes. River Mpanga in Fort Portal and River Semliki in Bundibugyo are in their lower courses. Here they wind across broad areas forming large loops with alluvial deposits. At their mouths, River Semliki enters Lake Albert while River Mpanga drains to Lake George, where deposition forms features cut by numerous interconnecting channels due to tidal action. Repeated flooding also creates wide flat areas along their banks.

During a field assessment by the Ministry of Water and Environment, you observed that the rivers wind across a large area with alluvial deposits forming large loops; at the lake inlets deposition occurs with interconnecting channels due to tidal action; and wide flat areas occur on either side due to repeated flooding and deposition. The assessment also

CamScanner

wide flat areas occur on either side due to repeated flooding and deposition. The assessment also noted seasonal flooding of the flat areas, siltation in Lakes George and Albert, and encroachment on alluvial areas for farming and settlement, threatening livelihoods in Fort Portal and Bundibugyo.

Fig.1 photograph of a river in Uganda.

Task:

As a national chairperson of the Environment Club of your school, you are asked to prepare a document to the Ministry of Water and Environment Summit, analyzing the geomorphic processes operating in the area, how they form the observed landforms, and propose measures to manage the challenges identified during the field assessment.

CamScanner

SECTION B

Respond to only **one** *item from this section.*

Item 3

For decades, Uganda and other African countries have joined global efforts to investigate the influence of human activities on climatic and weather changes in the country. Recently, the National Environment Management Authority (**NEMA**) from Kampala visited different areas of Uganda to study how different major sectors of the economy are influencing climatic changes in the country.

During the research, they discovered changes in weather patterns compared to the previous years. Some areas in Uganda were experiencing prolonged droughts, declining water levels, and the drying of pastures, while others frequently experienced excess rainfall, severe floods, landslides, and destructive storms.

Among the pastoral communities, the long dry spells are leading to water shortages and abrupt death of livestock.

Local leaders and stakeholders reported that the current changes in weather and climate patterns are mainly due to the agricultural sector, transport sector, settlement and urban growth, the mining sector, and the industrial sector.

However, **NEMA** experts have warned that unless proper environmental management measures are taken, this environmental phenomenon will continue to affect the country's development.

Task:

Examine how the above major sectors identified in the scenario are influencing the weather and climatic conditions described. Recommend appropriate measures that **NEMA** and the youth can undertake to address the above environmental challenges.

CamScanner

Item 4

Regional and global studies show that the space above the Earth's surface is made up of various layers which may vary in terms of density and composition. It is through this space that the energy from the sun reaches the Earth. This energy is received as solar radiation. However, this solar radiation is not evenly received in the different locations of East Africa due to different factors that influence the amount of solar radiation received in a place.

Northern and North Eastern Uganda, Northern Kenya among other areas of East Africa experience intense solar radiation due to the tropical location and relatively low cloud cover. However, the local people in these regions are only using this intense solar radiation for subsistence purposes like drying farm produce and warming bathing water among others, with less commercial benefits.

A foreign company intending to invest in solar related products is seeking your guidance to organize community sensitization in most of these regions with intense solar radiation on the opportunities for commercialization of this solar energy from the sun to help most of the local people improve their way of life. The company seeks geographical advice and requires you to:

Task:

Prepare a sensitization message that will be used by the company officials in those regions. The message should include analysis of the factors influencing the weather condition described and propose strategies to commercialize the use of that weather conditions for the economic benefit of the communities identified.

© Kyenjojo Joint Examinations Board 2026

CamScanner

SECTION A

All *items in this section are* **compulsory**

Item 1

For this item use the East Africa: **1:50,000 (UGANADA)** *map extract of Moroto series Y732, sheet 27/3, Edition: 5-D.O. S 1972.*

Moroto District is one of the remote areas in North Eastern Uganda located at the boarder of Kenya. It is steeply sloping in the east and low-lying in the west. The major drainage systems in the area are radial patterns and dendritic. Due to steeply sloping nature of the land, Moroto is facing a number of challenges ranging from mass wasting, flooding of low-lying areas of Kakodereng and Kadilakenyi. Mount Moroto forest reserve has been encroached on by people to provide wood fuel and timber to sustain the growing population in Moroto town. tourists from UK came to visit the area on the map and they are currently lodging at the **rest house in Moroto DC,** they are interested to camp at the **trigonometric station** at grid reference **807861.** They are also interested in **mountain climbing.** You have been identified by one of the tour companies in the area to work as their tour guide.

Task

Make a writeup to be used in guiding the tourists. In the writeup, guide them to **locate the trigonometric station from the rest house**, spot for them the **highest peak of mount Moroto** in meters above sea level, ways of addressing challenges in the scenario and suggest safe economic activities that can be carried out while conserving the environment in the area.

Item 2

River Mpanga rises from a mountainous area before flowing across gently sloping land of Kabarole, Kyenjojo, Kamwenge and finally entering a low-lying plain of Kitagwenda where it enters Lake George. During a field study, Geography students observed that the river flows swiftly through narrow, steep-sided valleys in the upper section. At several points, the river suddenly drops over resistant rock layers, producing turbulent water. Further downstream, the channel becomes wider and follows a winding course across a broad valley. In some places, old sections of the river channel have been abandoned, leaving isolated water bodies. Near the river mouth as it enters Lake George, extensive flat land has developed due to the accumulation of fine sediments deposited during seasonal flooding. Raised banks occur alongside the river channel, while remnants of former valley floors can be seen above the present flood level.

The district has recently experienced increased flooding following extensive cultivation on steep slopes, sand mining, wetland reclamation, and vegetation clearance within the drainage basin. Local authorities have therefore initiated a program aimed at conserving the river basin while promoting sustainable use of the surrounding land.

© Kyenjojo Joint Examinations Board 2026

CamScanner

Task

You have been identified to lead the initiative, make a writeup you will present in one of the meetings with local authorities. The writeup should examine how River Mpanga has shaped the landscape in the area in the scenario and also suggest ways of conserving river Mpanga while utilizing it.

SECTION B

Respond to only **one** *item from this section.*

Items 3

Residents of Mwenge County have noticed remarkable environmental changes over the past 30 years. Older people explain that seasons were once more predictable, rivers flowed throughout the year, and crop production was relatively stable. Today, rainfall is highly erratic, dry spells last much longer than before, and unusually heavy rainfall occasionally causes rivers to overflow. Water levels in some streams decline significantly during certain months, while farmers increasingly adjust their planting dates because the weather has become difficult to predict.

Health workers report a rise in heat-related illnesses during unusually hot periods, while agricultural extension officers observe increasing challenges in maintaining food production under the changing weather conditions. Local authorities, together with community groups, have recently introduced several environmental conservation programs aimed at improving the condition of the area and strengthening the ability of communities to cope with these changes.

© Kyenjojo Joint Examinations Board 2026

CamScanner

You have been contacted as someone who is technical in meteorology to lead the community groups to examine the causes of environmental concern in the scenario.

Task

Write an article that you will submit to the county environmental authorities to be used in addressing the concern. In the article, Assess the causes of the environmental concern and suggest ways of dealing with concern.

Item 4

Residents living around Jinja and the Lake Victoria basin often wake up to misty mornings. During the rainy seasons, clothes take a long time to dry even when they are hung outside. Many people experience excessive sweating and discomfort despite not engaging in strenuous activities. Farmers frequently report fungal diseases affecting crops, while grains and other stored produce easily develop mould if they are not properly dried. Meteorological records show that the amount of water vapour in the atmosphere is highest in the morning but decreases as the day becomes warmer.

Meteorological department of the area is organizing a community out reach to increase awareness about the weather condition affecting people and educate the masses on how to manage the phenomena. You have been selected to take part in the outreach.

Task

Make a writeup that you will use to carryout mass mobilization. This document should describe the types of the weather condition in the scenario, how to measure and record the weather condition at the weather station and factors influencing the weather condition around the area identified in the scenario.

©2026 Matigo Examinations Board

SECTION A

All *items in this section are* **compulsory**.

Item 1

During a Geography lesson, the Senior Five students of Nkondo SSS studied the topic Drainage, particularly the subtopic Role of Rivers in Shaping the Landscape. Since they had already planned a Geography field excursion, they considered this topic ideal for field study. They therefore consulted their Geography teachers and some Senior Six students for guidance.

The Geography teachers selected Kiboga as the study area because the students wanted an area with a wide variety of drainage features, relief, vegetation, and human activities that would enrich learning in different aspects of physical and human geography.

On the scheduled day, the students travelled to the study area. They were each provided with the map extract of Kiboga Sheet 59/2, 3-U.S.D. and agreed to divide themselves into four groups to make data collection easier.

The first group entered from the south-western part of the area and came across River Kinoga. The second group entered from the south and encountered River Kyekumbya. The third group entered from the north-west and came across River Nakayenga. The fourth group entered from the north-east and encountered a magnificent unnamed river flowing sluggishly over a gentle gradient. Along this river, they observed several interesting landforms. Some had concave and convex shapes, others resembled a horse's shoe, while a number of them could not be accurately identified or described.

After regrouping, all the students discussed the features they had observed along the different river profiles. However, the fourth group was unable to correctly identify and describe the landforms they had observed along the unnamed river. They also agreed that these rivers posed several challenges to the local communities, but they could not explain how the communities could mitigate these challenges.

The students have therefore approached you, as a Senior Six student who has studied this topic, to help them identify the river landforms observed by the fourth group and explain how the local communities can mitigate the challenges associated with rivers.

Task

(a) Using any suitable illustration locate the features that were seen by all 4 groups.
(b) Give an account of the role of rivers in shaping the landscape seen by group members who entered from North East.
(c) How best can natives sustainably utilize these rivers?

Item 2

Kijana Valley is a densely populated region located near the boundary of two tectonic plates. The valley contains several towns, farms, factories, schools, and a major hydroelectric dam. For many years, geologists have warned that the area is vulnerable to seismic activity because of the presence of a major fault line running through the region.

On the morning of **15th June 2026**, residents of Kijana Valley experienced a **magnitude 7.2 earthquake**. The earthquake occurred at a shallow depth of **12 km**, with its epicentre located approximately **20 km east of the town of Luwanda**. The ground shaking lasted for nearly **50 seconds**, causing widespread panic and destruction. Several buildings collapsed, particularly older structures that had not been designed to withstand seismic activity. Roads and bridges were damaged, making it difficult for emergency services to reach the affected communities. Landslides blocked mountain roads, while cracks appeared in agricultural land. The hydroelectric dam also developed minor structural cracks, raising concerns about the safety of nearby settlements.

Thousands of people were displaced, and many families lost access to clean water, electricity, and medical services. Schools and hospitals were temporarily closed. In the weeks that followed, a series of aftershocks continued to affect the region, increasing fear among residents and complicating recovery efforts.

Government authorities, humanitarian organisations, and local communities have begun planning both immediate relief measures and long-term disaster management strategies. Scientists are also studying the event to better understand the tectonic processes responsible for the earthquake.

As a geologist living in the affected area, you have been asked to advise the local authorities and communities on the causes of the earthquake, its impacts, and appropriate measures to reduce the effects of future seismic events.

Tasks:
(a)Account for the occurrence of the above catastrophe in kijana valley
(b)Explain ways of mitigating the above catastrophe.

SECTION B

Respond to only **one** *item from this section.*

Item 3

Climate change in Uganda is no longer just a future concern; it is a pressing challenge that is already having profound socio-economic and political impacts. Ranked the **14th most vulnerable country** on the **ND-GAIN Index**, Uganda faces severe climate-related impacts that are worsened by widespread poverty and an overreliance on climate-sensitive sectors such as agriculture. The Rwenzori sub-region, in particular, is highly vulnerable, with young people among the most affected.

Erratic rainfall, floods, and prolonged droughts have greatly disrupted traditional agricultural practices, resulting in reduced crop yields, declining household incomes, food insecurity, and increased unemployment among the youth. These challenges have also contributed to environmental degradation, resource-based conflicts, and increased vulnerability to climate-related disasters.

The situation calls for urgent, comprehensive, youth-centred strategies to address the interconnected challenges of climate change, environmental degradation, conflict, and socio-economic instability. Implementing appropriate adaptation and mitigation measures can strengthen resilience, reduce vulnerability, and promote sustainable development in Uganda.

A climate change debate has been organised in your district, and you have been invited to participate as a climatologist.

Task.

Make a presentation in your speech talk about the causes of extreme weather conditions and ways of mitigating them.

Item 4.

Uganda and the rest of East Africa experience varying weather and climatic conditions throughout the year due to the movement and interaction of different air masses. These include the moist maritime air masses from the Indian Ocean, the dry continental air masses from the north-east, and the moist equatorial air masses associated with the **Inter-Tropical Convergence Zone (ITCZ)**. The characteristics of these air masses greatly influence rainfall distribution, temperature, humidity, cloud cover, wind patterns, and the occurrence of weather hazards such as droughts, floods, and thunderstorms.

In recent years, farmers in western Uganda have reported increased crop yields during seasons dominated by moist air masses, while pastoralists in north-eastern Uganda have experienced severe water shortages and pasture scarcity due to the prolonged influence of dry continental air masses. Urban centres have also experienced flooding following intense rainfall associated with moist maritime air masses.

In response to these changing weather patterns and their impacts on livelihoods, the Government of Uganda is sponsoring meteorologists to conduct further research on the characteristics and effects of air masses. You have been selected to represent your school at a meteorological conference organised by your district, where you are expected to explain how different air masses influence the weather and climate of Uganda and East Africa.

Task

Make a report that you will use to present at the conference .in your report consider the characteristics of three major air masses and their influence on climate of Uganda.

SECTION A

All items in this section are **compulsory.**

Item 1

The Uruguan ministry of finance and economic planning in 2023 conducted a comprehensive review of the foreign trade dependence and market diversification strategy.
The government was concerned about the over reliance on a few major trade partners, particularly those in Europe and North America.

The directorate of international trade under their ministry of foreign affairs has proposed new trade agreements with other emerging markets to avoid the exploitation in form of expensive tariffs by the former allies in trade. This has therefore prompted the intervention of the legislative assembly.

As a data analyst in the ministry of finance, the directorate of international trade needs a clear presentation of the current export structure to base on to adjust its decision. You as a student of geography well versed with statistical skills, you have been approached to help guide the Uruguan government research department to come up with satisfying and convincing reasons using the data provided.

Uruguay export trade with other countries 2023.

Important countries	Value in thousands	Percentage volume
United kingdom	37,908	33
U.S.A	21,699	19
Italy	12,382	11
Spain	12,11.5	11
Germany	11,674	10
Netherlands	10,533	09

Source: W.E.R 2023

Task:
Prepare a suitable graphical representation of Uruguan challenge towards the concern in the scenario above and give a justification for her decision.

Item 2

Uganda is among the many developing countries in the African continent. On the other hand, are countries in Europe like Britain, Scotland and North America. While USA, Canada and Mexico that are seen to be developed with high indicators of development in terms of quality health care systems, education, better infrastructure to mention but a few. Uganda can therefore have a lesson to draw from that counter parts of development.

Characteristically, developing countries have experienced steady GDP growth over the two decades prompting governments to introduce policies that attract foreign investment to boost their exports and improve infrastructure.

© WAKISSHA Joint Mock Examinations 2026

CamScanner

The regional (EAC) representatives, has been promised with this data about the GDP growth and poverty rates over the past years to analyze, and identify the status of trade challenges in Africa. And you as the president of your geography class have been requested to work along with the representative.

Year	GDP (growth rate %)
2019	4.2
2020	3.5
2021	5.1
2022	6.0
2023	5.8

Task:
Make a write up, explaining the challenges in the scenario towards sustainable development in Africa and propose possible strategies.

SECTION B

Respond to only **one** *item from this section.*

Item 3
Uganda has conducted population and housing censuses at approximately 10 years interval. The most recent census of 2024 was also the first digital census, using electronic devices to improve data collection accuracy. You are provided with a table showing statistics of Uganda's population from 1980 – 2024 to help in analyzing the trend and other information.

Table showing Uganda's total population in the census year between 1980 and 2024.

Census Year	Total Population
1980	12,636,179
1991	16,671,705
2002	24,227,279
2014	34,634,650
2024	45,905,417

Source **-** UBOS Dissemination:
Uganda's population over the past four decades 2024.

A local radio talk show hosted a discussion titled "our growing numbers a Blessing or a Burden" Callers had conflicting views about the impact of population growth on employment, urbanization, environment and service delivery. The show's host now wants to feature different opinions in the upcoming programe. You are among the members and you have been observing this.

Task:
Write a presentation to the show host expressing your view on the issue using your experience and observations in your country.

Turn Over

Item 4

The governments of East Africa are facing increasing demand for electricity due to rapid population growth, urbanization and industrial expansion. To address this, it plans to expand energy production through large scale hydro power projects along rivers while encouraging investment in solar, wind, thermal and geothermal energies.

However the policies to address the challenges have achieved success and bottlenecks to ensure balance between economic growth, environmental protection and social welfare. As an energy expert you have been provided with a table showing different sources of energy generated in Kwh by four countries in 2024 to help guide East Africa's demand.

Country type	USA	Germany	China	Uganda
Coal	700	108	4800	0
Thermal gas	1,700	95	0	0.2
Nuclear	800	12	450	0
Hydro	242	30	1,356	6
Wind + Solar	850	225	1,300	0.2

Task:

(a) With the help of the provided data as referenced to any one country in East Africa, explain how the energy crisis can be addressed.

END
