Item 1

The manager of a new factory producing dry cells had been receiving complaints from the community members about the quality of the dry cells they are using in their radios. The concerned members said that the e.m.f of the dry cells from the factory drops rapidly and their radios would stop working, prompting one member to say that a standard dry cell has e.m.f between 1.3V and 1.7V inclusive. The second member however moved to a nearby shop and bought a new pair dry cells from the same factory but the value of e.m.f was not indicated on them and has contacted you for help.

Task

You are provided with one dry cell from the laboratory with similar properties to the one bought from the shop by the second member, comment on its suitability in the radio by carrying out the scientific investigation.

Item 2

A school is planning to administer physics practical examination to students.

A laboratory technician was told to provide each student with a metre rule with mass in the range 75g to 140g. The school supplier delivered metre rules but their masses are not known. The technician wanted to verify the mass of the metre rules; however, the weighing scale is faulty.

You are provided with a sample of the metre rules delivered to the school.

Task

Design and carry out an investigation to confirm whether the metre rules supplied are suitable for the physics practical examination.
